SELECTED WATER RESOURCES ABSTRACTS

DEPOSITORY
SEP 2 1981
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 14, NUMBER 13
JULY 1, 1981

W81-02401 -- W81-02650
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 13
JULY 1, 1981

W81-02401 -- W81-02650

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

1. NATURE OF WATER

1A. Properties

THERMAL SPRINGS IN THE PAYETTE RIVER BASIN, WEST-CENTRAL IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
R. E. Lewis, and H. W. Young.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $6.00 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-1020 (WRI), October, 1980. 23 p, 4 Fig, 4 Tab, 18 Ref, 2 Plates.

Descriptors: *Geothermal studies, *Thermal springs, *Chemical analysis, *Idaho, Hydrogeology, Water temperature, Stable isotopes, Radioisotopes, Discharge(Water), Heat balance, *Payette River basin(ID), Idaho batholith.

The Payette River basin, characterized by steep, rugged mountains and narrow river valleys, occupies an area of about 3,300 square miles in west-central Idaho. Predominant rock types in the basin include granitic rocks of the Idaho batholith and basalt flows of the Columbia River Basalt Group. Waters from thermal springs in the basin, temperatures of which range from 34 to 86 degrees Celsius, are sodium bicarbonate types and are slightly alkaline. Dissolved-solids concentrations range from 173 to 470 milligrams per liter. Reservoir temperatures determined from the sodium-potassium-calcium and silicic acid-corrected silica geothermometers range from 53 to 143 degrees Celsius. Tritium, present in concentrations between 0 and 2 tritium units, indicate sampled thermal waters are at least 100 years old and possibly more than 1,000 years old. Stable isotope data indicate it is unlikely any of the nonthermal waters sampled are representative of precipitation that recharges the thermal springs in the basin. Thermal springs discharged about 5,700 acre-feet of water in 1979. Associated convective heat flux is 1.1x10 to the 7th power calories per second. (USGS)

2. WATER CYCLE

2A. General

SNOWMELT INFILTRATION AND RUNOFF ON FROZEN GROUND,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. L. Kane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185274, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, No 80-06, February, 1981. 23 p, 10 Fig, 1 Tab, 7 Ref. OWRT-A-068-ALAS(1).

Descriptors: *Snowmelt, Surface runoff, *Soil moisture, *Frozen ground, *Infiltration, *Runoff forecasting, Rainfall-runoff relationships, Melting, Overland flow, Runoff, Soilwater movement, Ablation, Snowfall, Surface drainage, Water sources, Water supply, Analytical techniques, Frozen soils, Thawing, Leachate, Research and development.

Many cold region floods have resulted by snow ablation. Accurate flood magnitude predictions using computer models hinge on an understanding of the hydrologic role of frozen soils. Moisture content was examined to determine how its profile in soils changes over the Winter season, and how such moisture redistribution influences snowmelt infiltration in the Spring. Soil moisture generally migrated towards the freezing front from warmer soils, resulting in moisture content increase near the mineral soil surface. With high ice contents, the infiltration rate (IR) is reduced and greater runoff is produced. The variation in IR of Fairbanks silt loom for frozen and unfrozen conditions was studied using double ring infiltrometer test methods. Typical IR values for unfrozen soil range from .003-.010 mm/second. Dry frozen soil IR rates were usually slightly less than the unfrozen case, due to ice lenses that developed near the surface. For moisture-rich soil, a substantial reduction in IR was noted, with values as low as .0000002 mm/second. Low IR rate areas would be suspected as runoff generating areas. (Zielinski-IPA)

2B. Precipitation

THE HIPLEX PROGRAM IN COLBY-GOODLAND, KANSAS: 1976-1980,
Environmental Research and Technology, Inc., Concord, MA.
R. K. Crane, and K. R. Hardy.
Document P-1552-F, prepared for Water and Power Resources Service, Denver, Colorado, January, 1981. 152 p, 44 Fig, 11 Tab, 38 Ref, 2 Append. 14-06-D-7673.

Descriptors: *Radar, *Cloud physics, *Meteorological data collection, *Precipitation, *Weather modification, Cloud seeding, Rainstorms, Rain gages, Computer programs, Kansas, Nebraska, Colorado.

The primary goal of HIPLEX is to develop and evaluate the use of seeding techniques for the enhancement of precipitation in the high plains area. Accurate and reliable methods are required for the observation of the water mass produced by a storm and for the estimation of the water mass a seeded storm would have produced if it were not seeded. As a part of HIPLEX, a major field program was conducted in the Colby-Goodland area of Kansas over a period of 5 years. A radar based precipitation measurement capability was established in the tri-state area within 150 km of Goodland, Kansas. Automated radar cell detection and tracking programs were developed for the CYBER 74. The storm elements in the radar analysis sample exhibited a high degree of internal organization, with the cells of the storm elements occurring in clusters. The precipitation parameter defined as the water flux per significant cell, and cluster displayed the most consistent storm to storm behavior. An estimate of the modification potential of the Kansas storms led to an expected increase in rainfall of less than 4%. If seeding operations are constrained to days with no local warnings and are successful only for isolated storms, the expected increase in precipitation is less than one percent. (Moore-SRC)
W81-02501

2C. Snow, Ice, and Frost

SATELLITE OBSERVATION OF GREAT LAKES ICE - WINTER 1978-79,
National Environmental Satellite Service, Washington, DC.
J. Wartha-Clark.
Technical Memorandum NESS 112, October, 1980. 39 p, 26 Fig, 1 Ref.

Descriptors: *Lakes, *Lake ice, *Ice formation, *Ice cover, Wind, Air temperature, Satellite technology, Remote sensing.

Ice conditions on the five Great Lakes and Lake St. Clair were monitored from satellite imagery from TIROS-N and the Geostationary Operational Environmental Satellite (GOES). The formation, movement, and dissipation of lake ice were traced from December 1978 through May 1979. Local climatological data were observed at 16 ground stations. Maximum extent of ice occurred simultaneously on all of the Great Lakes on February 17. The ice season on Lake Superior began near December 28 and lasted until May 12, a full 135 days with maximum extent of 100% ice coverage occurring on February 17. The ice season on Lake Michigan began on December 9 and ended near April 27, a total of at least 140 days. Ice began forming in Lake Huron on December 10 and lasted until April 28, a total of 139 days with maximum extent of 95% concentration. The ice season on Lake St. Clair commenced December 15 and ended on March 27, with 100% coverage from January 11 through March 11. The ice season on Lake Erie lasted from December 15 until April 29, a total of 136 days, with maximum extent of ice occurring on February 27 with a greater than 95% concentration. For Lake Ontario, the ice season commenced on January 9 and ended on March 27, a total of 78 days, with maximum ice extent of 80% coverage. Air temperatures at the stations surrounding the lakes are correlated with ice formation and degeneration; ice movement is a function of wind speed and direction. (Moore-SRC)
W81-02507

2E. Streamflow and Runoff

FLOODS OF JANUARY AND FEBRUARY 1980 IN CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
K. L. Wahl, J. R. Crippen, and J. M. Knott.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $7.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1005, August, 1980. 52 p, 16 Fig, 6 Tab.

Descriptors: *Floods, *Flood flow, *Peak discharge, Storm runoff, *California, Flood damage, *Flood data, Sediment discharge, Flood stages, Flood discharge, Precipitation(Atmospheric), Southern California.

During January and February 1980, storms caused substantial rises in streamflow throughout much of California. In mid-January flooding occurred in the foothills of the Sierra Nevada and in the central coast area. In late January and mid-February, high floodflows in streams in coastal southern California caused much damage and several deaths. The Tijuana River in northern Baja California and southern San Diego County flooded many square miles of lowlands as its flow during two separate flooding episodes exceeded all records. Most reservoirs in San Diego County spilled, several for the first time since their completion. Lake Elsinore, in eastern Riverside County, caused damage to lakeside property as it filled to an elevation not reached since 1916. February flooding in southern California was caused by a series of storms separated by short intervals. Some peaks of record were observed, and streamflow throughout the area remained high for a relatively long period. In many streams, the volume of sustained flow for periods of 7 and 15 consecutive days were the greatest that have occurred during the period of record. (USGS)
W81-02457

FLOODS IN INDIANA, JUNE-AUGUST 1979,
Geological Survey, Indianapolis, IN. Water Resources Div.
R. L. Gold, and S. W. Wolcott.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $8.75 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-1204, November, 1980. 64 p, 24 Fig, 6 Tab, 5 Ref.

Descriptors: *Floods, *Indiana, *Peak discharge, *Streamflow, *Flood damage, Flood recurrence interval, Storms, Hydrologic data, Flood stages, Observation wells, Sites, Hydrographs, Hurricane Bob, Hurricane Claudette.

This report documents rainstorms and resultant floods in central and southern Indiana during the summer of 1979. Major flooding was caused by three storms, one in June and two in July 1979, centered primarily in central and southern Indiana. Peak discharge exceeded the 100-year recurrence interval at 16 sites in this area. State Civil Defense officials estimated that almost 50-million dollars damage was attributable to the July floods. Hydrologic data have been tabulated for streamflow sites in the areas of flooding. Reservoir storage volumes, observation-well data, rainfall totals, and discharge hydrographs are presented to show the intensity and time of the storms and resultant floods. (USGS)
W81-02471

STREAMFLOW MODEL OF WISCONSIN RIVER FOR ESTIMATING FLOOD FREQUENCY AND VOLUME,
Geological Survey, Madison, WI. Water Resources Div.
W. R. Krug, and L. B. House.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $7.50 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 80-1103 (WRI), November, 1980. 44 p, 14 Fig, 5 Tab, 3 Ref, 2 Append, 1 Plate.

Descriptors: *Computer models, *Streamflow, Routing, *Flood frequency, *Flood discharge, Simulation analysis, Reservoirs, Reservoir operation, Regulated flow, Natural flow, Streamflow forecasting, Flood recurrence interval, Annual peak discharge, Model studies, Hydrographs, *Wisconsin, *Wisconsin River.

A set of daily streamflow-routing models are used to simulate streamflow at 10 sites along the Wisconsin River for water years 1915-76, to determine the effects the reservoir system has on flood discharges. Streamflow is simulated under the following two conditions: (1) No reservoirs are in the system and (2) all of the present reservoirs are in place and operated with current rules. At Wisconsin Dells, 20 miles upstream from Portage, daily streamflow hydrographs are estimated for the 10-, 50-, 100-, and 500-year floods. These were determined from statistical analysis of the simulated daily streamflows for the condition of all reservoirs in place. The reservoirs have a significant impact on floods. The mean annual flood peak at Wisconsin Dells is lowered about 20% from 43,000 cubic feet per second for the simulated, unregulated condition to 34,000 cubic feet per second for the simulated, regulated condition. The 100-year flood peak at Wisconsin Dells is reduced about 10% (92,000 to 82,000 cubic feet per second) between the simulated, unregulated and simulated, regulated conditions. The 100-year flood peak at Wisconsin Dells, computed from the simulated, regulated streamflow data for the period 1915-76, is 82,000 cubic feet per second, including the effects of all the reservoirs in the river system, as they are currently operated. It also includes the effects of Lakes Du Bay, Petenwell, and Castle Rock which are significant for spring floods but are insignificant for summer or fall floods because they are normally maintained nearly full in the summer and fall and have very little storage for floodwaters. (USGS)

GEOMORPHIC-HYDROLOGIC METHODS FOR ASSESSING FLOOD POTENTIAL IN SOUTHERN NEW ENGLAND,
Wesleyan Univ., Middletown, CT.
P. C. Patton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189862, Price codes: A03 in paper copy, A01 in microfiche. Institute of Water Resources, The University of Connecticut, Storrs Research Project Technical Completion Report, 1981. 25 p, 10 Fig, 13 Ref. OWRT A-078-CONN(2), 14-34-0001-7014.

Descriptors: Floods, Flood plain sedimentation, *Flood forecasting, *New England, Paleohydrology, Holocene fluvial stratigraphy, *Flood plains, *Sediment transport, Flood frequency, Geomorphology.

The morphology and stratigraphy of Holocene fluvial landforms in southwestern New England can be used to estimate the magnitude and frequency of rare floods. Three geomorphic features, debris fans, Holocene terrace and active flood plains were investigated to determine their usefulness for paleohydrologic studies. Dated flood sedimentation units on debris fans indicate that deposition on these features is controlled by relatively high frequency flow events of moderate size. Therefore, debris fans are probably not useful geomorphic features for paleohydrologic studies. Flood sedimentation units preserved on Holocene terraces and flood plains on western Connecticut streams can be used to interpret past flood events. Sedimentation on these surfaces is strongly controlled by valley morphology. In the mouths of back flooded tributaries and upstream from valley constrictions ponded water creates slackwater depositional sites. A slackwater site in the Housatonic River valley interbedded with archeological remains records a flood that occurred in the past 3,000 years. This flood was probably greater than the existing historical flood of record. Downstream from valley constrictions flood sedimentation creates coarse gravel layers across the flood plains and low terraces. These layers are preserved in vertical sequences that record the frequency of high magnitude floods. Finally, the flood sedimentation models developed are useful in predicting sedimentation patterns on river flood plains and terraces. This information has been used in western Connecticut to aid in the evaluation of potentially valuable archeological sites.

BIVARIATE GAMMA DISTRIBUTIONS FOR EXTENDING ANNUAL STREAMFLOW RECORDS FROM PRECIPITATION: SOME LARGE-SCALE RESULTS,
Instituto de Pesquisas Hidraulicas, Porto Alegre (Brazil).
R. T. Clarke.
Water Resources Research, Vol 16, No 5, p 863-870, October, 1980. 5 Tab, 6 Ref.

Descriptors: *Streamflow forecasting, *Estimating, *Mathematical models, Forecasting, Flow, River forecasting, Precipitation, Hydrology, Model studies.

Streamflow records may be extended by correlation with longer records of precipitation to estimate the mean of the extended streamflow record. Assuming a bivariate gamma distribution for streamflow and precipitation and a sufficiently long record, estimates are obtained and compared using three methods: maximum likelihood, ratio estimate, and regression estimate. This model is recommended for hydrological use only after certain questions have been answered: How can a user determine if his data are bivariate. What differences would result if bivariate distribution were to be used in place of a more appropriate alternative. (Cassar-FRC)

2F. Groundwater

DEVELOPMENT OF A DIGITAL MODEL OF GROUNDWATER FLOW IN DEEPLY WEATHERED CRYSTALLINE ROCK, CHESTER COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
L. J. McGreevy, and R. A. Sloto.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-132896, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-2, August, 1980. 42 p, 22 Fig, 1 Tab, 13 Ref.

Descriptors: *Computer models, Groundwater, *Base flow, *Crystalline rocks, *Pennsylvania, Model studies, Aquifer characteristics, Water table, *Groundwater movement, Recharge, Surface-groundwater relationships, Water quality, Land development, Forecasting, Hydrogeology, Chester County(PA), Pickering Creek(PA), Piedmont.

The model simulates recharge to, flow through, and discharge from the water-table aquifer in a 5.98 square mile basin representative of most of Chester County, Pa. The two-dimensional finite-difference model of Trescott, Pinder, and Larson was used. The way groundwater evapotranspiration varies with depth was modified, and a minimum transmissivity was added to prevent the model from 'going dry'. Tests of the model showed good correlation with field data, but also showed that additional information would make the model more reliable. Particularly helpful would be more water-level and evapotranspiration data, synoptic base-flow measurements, and information the variation of permeability and specific yield with depth. Residential development was simulated in 1 square mile of the basin using combinations of the following conditions: 1 acre, 1/2 acre, and 1/4 acre lot size; waste water disposal by septic systems or by public sewering; domestic wells or public-supply wells for water supply; and 0, 1, and 5% reduction in recharge in the developed area. Where domestic water is supplied by local groundwater, decreased lot size and reduced recharge cause increased drawdowns and reduced base flow. When waste water is exported by sewers, these effects are magnified. (USGS)

MAJOR AQUIFERS IN AURORA AND JERAULD COUNTIES, SOUTH DAKOTA,
Geological Survey, Huron, SD. Water Resources Div.
L. J. Hamilton.
South Dakota Geological Survey, Vermillion, Information Pamphlet No 23, 1980. 5 p, 2 Fig.

Descriptors: *Groundwater, *Aquifers, *Water wells, *Water yield, *South Dakota, Aquifer characteristics, Hardness(Water), Dissolved solids, Aurora County(SD), Jerauld County(SD).

Five major glacial aquifers and three major bedrock aquifers underlie much of the 1,236 square miles of Aurora and Jerauld Counties, south-central South Dakota. The glacial aquifers generally are penetrated within 200 feet of the land surface and the bedrock aquifers from 100 feet to a maximum of 1,300 feet in the northwestern part of the study area. The glacial aquifers can yield as much as 1,000 gallons per minute to a well. Well yields for bedrock aquifers vary greatly. Yields for the Niobrara and Codell aquifers generally range between 2 and 75 gallons per minute, but a densely-fractured part of the Niobrara has yielded 1,500 gallons per minute. Reported yields for the Dakota aquifer are as large as 150 gallons per minute. The water yielded by glacial aquifers generally is very hard (hardness concentrations greater than 180 milligrams per liter) and has concentrations of dissolved solids ranging from 700 to 3,300 milligrams per liter. The Niobrara and Codell aquifers yield soft to moderately hard water (hardness concentrations less than 120 milligrams per liter) and the Dakota aquifer yields very hard water that has a maximum hardness of 1,400 milligrams per liter. The concentration of dissolved solids ranges from 1,100 to 2,400 milligrams per liter for water from bedrock aquifers. (USGS)

GROUNDWATER APPRAISAL IN NORTHWESTERN BIG STONE COUNTY, WEST-CENTRAL MINNESOTA,

Geological Survey, St. Paul, MN. Water Resources Div.
W. G. Soukup.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-568 (WRI), 1980. 41 p, 18 Fig, 2 Tab, 19 Ref.

Descriptors: *Groundwater resources, *Aquifers, *Aquifer characteristics, *Water quality, *Minnesota, Hydrogeology, Observation wells, Pumping, Transmissivity, Storage coefficient, Lithologic logs, Chemical analysis, Water resources development, *Big Stone County(MN).

Test augering south of Beardsley, Big Stone County, Minn., outlined a small surficial aquifer that consists of outwash deposits of sand and gravel. The aquifer is elongate, trending northeast-southwest, with a maximum saturated thickness of 42 feet and an areal extent of about 5 square miles. Deep test drilling showed that small buried outwash aquifers occur over much of the project area. A major buried outwash aquifer east of Beardsley consists of 130 feet of fine, uniform quartz sand. It lies in a steep-sided northwest-southeast trending valley eroded in bedrock and is overlain by 130 feet of clayey till. Pumping-test results indicate that transmissivity of the aquifer ranges from about 11,000 to 13,000 feet squared per day, and the storage coefficient ranges from 0.0001 to 0.002. Significant differences were found in chemical quality of water from the buried outwash and Cretaceous aquifers. Water from Cretaceous aquifers is softer than water from outwash aquifers, but contains concentrations of sodium and boron that are high enough to damage soils and crops if used for irrigation. Nitrate concentrations exceeded the Minnesota Pollution Control Agency's recommended limits for drinking water in one sample from the surficial aquifer. (USGS)

GROUNDWATER AVAILABILITY NEAR FORT WAYNE, ALLEN COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
M. Planert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-226038, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-34, March, 1980. 54 p, 25 Fig, 4 Tab, 9 Ref.

Descriptors: *Groundwater availability, *Groundwater resources, *Groundwater potential, *Glacial aquifers, *Indiana, Aquifer characteristics, Model studies, Data collections, Groundwater movement, Pumping, Water level fluctuations, Water supply, Evaluation, *Allen County(IN).

A 3-year study to determine the groundwater potential of confined glacial aquifers in a large part of Allen County, Ind., was begun in July 1974 by the U.S. Geological Survey. Mapping of outwash sands and gravels delineated two distinct layers of sand and gravel in the southern and eastern parts of the county that merge into one aquifer more than 100 feet thick to the north and west. A digital model that simulates groundwater flow in three dimensions was used to integrate the geologic and hydrologic conditions into a suitable analog of the groundwater system surrounding Fort Wayne. The model consisted of three layers representing (1) the upper till, (2) the upper sand and gravel, and (3) the lower aquifer. The lower aquifer represents a combination of the lower sand and gravel and a section of limestone aquifer immediately underlying the glacial sediments. The model, calibrated against water-level and streamflow data collected during September 1976, was used to simulate pumping and to evaluate the effects of pumping on groundwater levels and streamflows. Two distribution schemes of pumping were tested, each with two different boundary conditions (constant heads and constant flows). The results of these simulated pumping schemes indicate that between 30 and 40 million gallons per day can be produced and that the streamflow losses resulting from this pumping would be between 17 and 25 million gallons per day. THREE-DIMENSIONAL DIGITAL-COMPUTER MODEL OF THE FERRON SANDSTONE AQUIFER NEAR EMERY, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
D. J. Morrissey, G. C. Lines, and S. D. Bartholoma.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-128449, Price codes: A06 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-62, October, 1980. 101 p, 8 Fig, 3 Tab, 3 Ref.

Descriptors: *Computer models, *Groundwater movement, *Saturated flow, *Finite element analysis, *Utah, Simulation analysis, Forecasting, Mine water, Dewatering, Aquifer characteristics, Water levels, Transmissivity, Storage coefficient, Calibrations, Methodology, Emery(UT), Ferron sandstone aquifer(UT).

A three-dimensional finite-difference computer model of the Ferron sandstone aquifer was used to simulate groundwater flow in the Emery coal field in east-central Utah. The model also was used to predict the effects of proposed surface mining and the resulting mine dewatering on potentiometric surfaces of the aquifer. The model was calibrated in a steady-state simulation using water levels and manmade discharges from the aquifer that were observed during 1979. Too few data were available to verify the calibrated model in a transient-state simulation with historical aquifer response to manmade discharges. Predictions made with the model are considered to be semiquantitative. Discharge from the proposed surface mine was predicted to average 0.3 cubic foot per second through 15 years of operation. Drawdowns of 5 feet in the potentiometric surface of the aquifer were predicted to extend as much as 3 miles from the proposed mine after 15 years of operation. (USGS)

2H. Lakes

HYDROLOGY OF THE LAKE DEATON AND LAKE OKAHUMPKA AREA, NORTHEAST SUMTER COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
E. P. Simonds, and E. R. German.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-733, 1980. 11 Fig, 3 Tab, 10 Ref, 1 Sheet.

Descriptors: *Lakes, *Lake morphology, *Hydrologic data, *Aquifers, *Florida, Evaporation, Rainfall, Water levels, Potentiometric level, Eutrophication, Phytoplankton, Water quality, Water analysis, Nutrients, *Sumter County(FL), *Lake Deaton(FL), *Lake Okahumpka(FL), Surface-groundwater relations.

The Floridan aquifer in the Lake Deaton and Lake Okahumpka area is 50 to 130 feet below land surface. During the 16-year period 1963-78 lake evaporation exceeded rainfall by 0.4 inches. Drainage from Lake Deaton and its surrounding area goes into Chitty Chatty Creek and on the Hogeye Sink when the altitude of the potentiometric surface of the Floridan aquifer is low. During a higher altitude of the Floridan potentiometric surface, Hogeye Sink may discharge water; this water, along with the normal runoff, goes into Lake Okahumpka. Average lake fluctuation is 1.5 to 2.0 feet per year. Lake Deaton supports a large population of blue-green algae and Lake Okahumpka is choked with aquatic plants. The water quality of the two lakes differ, with Lake Deaton having a sodium chloride water and Lake Okahumpka having a calcium bicarbonate water. Analysis of water and bottom material samples showed that only cadmium and mercury exceeded the Florida Department of Environmental Regulation's criteria for Class III waters; however, the amounts detected were at or slightly above the limits of the analytical method. A SIMPLE IN SITU METHOD FOR MEASURING BENTHIC RESPIRATION,
Ministry of Agriculture, Tiberias (Israel). Unit for Applied Research in Intensive Fish Culture.
J. Shapiro, and O. Zur.
Water Research, Vol 15, No 2, p 283-285, February, 1981. 2 Fig, 1 Tab, 6 Ref.

Descriptors: *Respiration, *Benthos, *On-site tests, Aquiculture, Dissolved oxygen, Toxins, Water quality, Sediments, Mud-water interfaces, Water pollution, Analytical techniques, *Fish stocking, Aquatic populations, Number fish per acre, Anaerobic conditions.

It has been shown in fish culturing that anaerobic conditions at the bottom of ponds due to accumulation of organic matter may result in the production of toxins that are inhibitory to fish growth. It is therefore of benefit to have a knowledge of the physical and chemical conditions of the bottom sediments, including data on benthic community respiration. A simple and accurate procedure for the in situ measurement of benthic community respiration involving determinations of bottom mud dissolved oxygen (DO) is reported. PVC columns 100 cm long and 5.65 cm in diameter were inserted into pond bottom muds to a depth of 10 cm, and DO levels were measured at sunrise and in the afternoon at 20, 40, 60, and 80 cm of the columns. During the 47 day experimental period, the rate of pond soil respiration increased from 0 to 130 and 0 to 220 in the ponds stocked with 7,000 and 20,000 fish per hectare, respectively. Results also indicated that changes in soil respiration may be related to variations in stocking and feeding rates in the pond. (Geiger-FRC)

BENTHIC OXYGEN DEMAND IN LAKE APOPKA, FLORIDA,
Florida Inst. of Tech., Melbourne. Dept. of Environmental Engineering and Science.
T. V. Belanger.
Water Research, Vol 15, No 2, p 267-274, February, 1981. 6 Fig, 3 Tab, 20 Ref.

Descriptors: *Oxygen demand, *Lake sediments, *Benthos, Eutrophication, Biochemical oxygen demand, Respiration, Lakes, *Florida, Analytical techniques, On-site tests, Laboratory tests, Nitrogen, Aquatic bacteria, Mixing, Water analysis, Flow rates, Lake Apopka.

Rates of oxygen uptake by the sediments of Lake Apopka, Florida, were measured to clarify the role of the benthic oxygen demand in the oxygen dynamics of this system. Laboratory core uptake and flow-through system techniques were used for the

determinations of oxygen demand at 5 sampling stations on the lake. Partitioning experiments showed that the oxygen uptake was mainly biological, and the majority of this was due to bacterial respiration. Core uptake for the 5 sampling sites averaged 67 milligrams 02/sq meter/hour, with no significant correlations with levels of total Kjeldahl nitrogen, percent volatile solids, or macroinvertebrate densities. A logarithmic relationship between the sediment oxygen uptake rates and the flow rate is described. At high flow rates (over 200 liters/hour), the flow-through system sediment oxygen uptake at each station approached similar maximum uptake rates of 130 milligrams 02/sq meter/hour. During periods of intense wind mixing, the sediment uptake rates are expected to approximate these values due to the extreme shallowness of the lake. The relatively low sediment oxygen uptake rates obtained for Lake Apopka support the hypothesis that sediment respiration is progressively replaced by respiration in the water column during eutrophication. (Geiger-FRC)
W81-02575

ENRICHMENT OF LAKE WINGRA, WISCONSIN, BY SUBMERSED MACROPHYTE DECAY,
Wisconsin Univ., Madison. Dept. of Botany.
S. R. Carpenter.
Ecology, Vol 61, No 5, p 1145-1155, October, 1980. 10 Fig, 4 Tab, 44 Ref.

Descriptors: *Lakes, *Nutrients, *Dissolved oxygen, Phosphorus, Oxygen, *Wisconsin, Eutrophication, Lake Wingra, Decomposing organic matter, Growth, Population.

Enrichment in Lake Wingra was investigated. This enrichment arises due to the decomposition of submersed aquatic vegetation. A model was constructed to predict the release on a daily basis of dissolved total phosphorus and dissolved organic matter. Fairly accurate predictions of decay rates and the phosphorus content of decaying shoots were attained. During the summer and autumn the decaying macrophytes are a major source of biologically available dissolved total phosphorus and decomposable dissolved organic matter for the pelagic community. Thus macrophyte decay potentially stimulated pelagic production. Among comparably productive stands of different species decomposing in the same lake, significant differences were noted in the timing of dissolved total phosphorus and dissolved organic matter releases. 2I. Water In Plants

PROTEIN AND NITRATE CONTENT OF LEMNA SP. AS A FUNCTION OF DEVELOPMENTAL STAGE AND INCUBATION TEMPERATURE,
California Univ., Davis. Dept. of Land, Air and Water Resources.
A. W. Knight, W. K. Silk, and P. W. Lehman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189888, Price codes: A02 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis Technical Completion Report, March, 1981. 19 p, 10 Fig, 2 Tab. (California Water Resources Center Project UCAL-WRC-W-542). OWRT-A-068-CAL(1).

Descriptors: *Irrigation, *Return flow, *Plant populations, Proteins, Nitrates, Roots, *Root systems, Growth stages, Plant growth, Temperature, Aquatic populations, Successions, *Nutrient removal, Duckweed.

Lemna protein per frond and per root increases with developmental stage until plants are at least two generations old. Protein per frond, per root, and per unit dry weight is greater in plants grown at 23.9C than at 18.3C. More protein is found in fronds than in roots, and more nitrate occurs in roots than in fronds. Nitrate per root increases with developmental stage and is higher (per root) in plants grown at 23.9C than at 18.3C. This distribution of generations within a growing population is constant for at least eight doubling times. Whether populations multiply slowly at 15.6C or more rapidly at 23.9C, fronds which have not yet produced progeny form 62% of the population fronds which are one generation old form 24% of the population; and fronds which are two generations old form 9% of the population. (Snyder-California)

2J. Erosion and Sedimentation

SEDIMENT AND WATER DISCHARGE OF THE COLORADO RIVER AT MATAGORDA, TEXAS, MAY 4-7, AND JUNE 7-11, 1979,
Geological Survey, Austin, TX. Water Resources Div.
C. T. Welborn, and F. L. Andrews.
Geological Survey Open-File Report 80-1177, October, 1980. 21 p, 5 Fig, 2 Tab, 4 Ref.

Descriptors: Sediment load, *Sediment yield, Sediment transport, *Colorado River, *Texas, *Streamflow, Data collections, Suspended load, *Sediment discharge, Particle size, Bed load, Sediment distribution, Sedimentation rates, *Matagorda Bay.

The U.S. Army Corps of Engineers requested the U.S. Geological Survey to collect data on the Colorado River at Matagorda, Texas, to determine the total sediment discharge into Matagorda Bay if all the water from the Colorado River were diverted into the bay. Data were collected from two floods (May 4-7, and June 7-11, 1979) with peak discharges of 24,900 cubic feet per second and 40,900 cubic feet per second. The total suspended-sediment discharge from the first flood was approximately 201,000 tons, and the total suspended-sediment discharge from the second flood was 630,000 tons. The volume of sediment from these two floods was approximately 970 acre-feet with approximately 20 acre-feet of this total being the bed load. (USGS)

WATER USE, GROUNDWATER CONDITIONS, AND SLOPE FAILURE ON BENCHLANDS IN WESTERN MONTANA: THE DARBY SLIDE EXAMPLE,
Montana Univ., Missoula.
J. D. Hoffman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189854, Price codes: A04 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Bozeman Report No 109, Bozeman, 1980. 56 p, 12 Fig, 32 Ref, 4 Append. OWRT A-114-MONT(1), 14-34-0001-9028.

Descriptors: *Geologic formations, Groundwater recharge, *Seepage, Failure, Hydrogeology, Geologic investigations, Lithologic logs, *Slope degradation, *Montana, *Landslides, Water use, Erosion, Western Montana, Darby slide, Slope failure.

Slope failures, a problem on benchlands of western Montana, affect all who live on the land. A better understanding of lithology and groundwater, both associated with this problem, will help land planners assess risks. The Darby slide provided an opportunity to study the geologic and hydrogeologic conditions existing at the time of failure, and to compare these conditions with those conditions existing now at past failures on the bench west of Darby. Two conditions were similar at the larger of the slope failures of the area: groundwater seeps occurring within areas of failure; and the presence of smectite rich sand similar to exposures of weathered bedrock. A plot of identified groundwater seeps and slope failures shows a concentration along linear features mapped on high altitude aerial photographs. The linears may represent weathered ridges of granitic and volcanic rocks that have been buried by Tertiary gravels and sands. These ridges could act as aquacludes, causing groundwater levels to build up within the porous gravels. Landslides such as the Darby slide can then be explained as a failure of the underground 'dam' when the mass of the gravel and water 'reservoir' becomes too great. Groundwater of many western Montana benches is recharged not only by precipitation and runoff, but also by agricultural and domestic practices. A better knowledge of these linear features would thus be invaluable to land planners.

SUSPENDED SEDIMENT PRODUCTION POTENTIAL ON UNDISTURBED FOREST LAND,
New Mexico State Univ., Las Cruces. Dept. of Agricultural Economics and Agricultural Business.
J. M. Fowler, and E. O. Heady.
Journal of Soil and Water Conservation, Vol 36, No 1, p 47-50, January/February, 1981. 4 Fig, 1 Tab, 20 Ref.

Descriptors: *Forests, *Sediments, *Surface runoff, Sedimentation rates, Water pollution sources, Agricultural runoff, Sediment load, Model studies, *Suspended sediments, Forest watersheds.

Estimation of suspended sediment production rates on undisturbed forest land is reviewed. The 614 million acres of undisturbed forest land in the US annually contributes more than 100 million tons of suspended sediments to waterways, and rates of this sedimentation can be used for comparisons with rates on silvicultural lands. Some of the basic estimates involved in building a forest model which can be linked with the Iowa State University agricultural model include: parent soil material, drainage area, rainfall, runoff, slope, and elevation. Published research results for watersheds with over 95% of area in undisturbed forest were used. Selected equations and statistics are presented by region. Nonpoint pollution from undisturbed forest land was found to vary widely, ranging from .001 to .009 tons per acre per year in scattered producing areas to as much as 3.3 tons per acre per year on isolated forests in the southern and Pacific Coast areas. When results of sedimentation from forest areas are combined with results from agricultural lands, the Northwest and Southeast were found to have the heaviest suspended sedimentation rates in the contiguous United States. OCCURRENCE AND DISTRIBUTION OF OXYGEN AND ORGANIC COMPOUNDS IN MOUNTAIN STREAMS OF THE MARMOT BASIN,
Calgary Univ. (Alberta). Kananaskis Center for Environmental Research.
S. A. Telang, G. W. Hodgson, and B. L. Baker.
Journal of Environmental Quality, Vol 10, No 1, p 18-22, January/March, 1981. 2 Fig, 2 Tab, 27 Ref.

Descriptors: *Natural streams, *Dissolved oxygen, *Organic compounds, Humic acid, Fulvic acid, Biochemical oxygen demand, Chemical oxygen demand, Water quality, Water analysis, Carbohydrates, Phenols, Amino acids, Seasonal, *Canada, Alberta, Marmot basin.

The occurrence and distribution of organic compounds were examined in relation to oxygen content in the pristine mountain waters of the Marmot basin streams in Alberta, Canada. The levels of dissolved oxygen (DO) in the streams averaged 11,000 micrograms/liter, representing a saturation level of 90-105%. Biochemical oxygen demand was, on the average, 2,000 micrograms/liter, while chemical oxygen demand averaged 4,000 micrograms/liter. The average total organic carbon was 4,000 micrograms/liter, with 25% of this represented by the compounds analyzed. Of this percentage, 2% were labile and 23% refractory organic compounds. The main refractory components, humic and fulvic acids, averaged 790 micrograms/liter, while tannins and lignins averaged 100 micrograms/liter. Of the labile compounds, 0.05 micrograms/liter were hydrocarbons, 2 micrograms/liter were phenols, 2 micrograms/liter were fatty acids, 45 micrograms/liter were carbohydrates, and 10 micrograms/liter were amino acids. The amounts of organic compounds present showed seasonal variations. Since these waters were considered to be virtually untouched by human activities, the source of these organic compounds was concluded to be runoff from terrestrial wildlife and vegetation activities as well as effluents from the vital processes of aquatic flora and fauna. 2L. Estuaries

COTIDAL CHARTS FOR CANADA,
Marine Sciences and Information Directorate, Ottawa (Ontario).
G. Godin.
Manuscript Report Series No 55, 1980. 93 p, 16 Fig, 6 Tab, 16 Ref.

Descriptors: *Canada, *Tides, *Flow profiles, *Tidal waters, Charts, Hydrographs, Maps, Tidal effects, Water circulation, Foreign countries, Geographical regions, Regions, North America, Bodies of water, Currents(Water), Ocean circulation, Ocean currents, Intertidal areas, Diurnal, Estuaries, Data collections, Synoptic data, Saline water intrusion.

Cotidal charts provide a visual summary of available information about the major harmonic constituents of the vertical tide. Elementary physical theory indicates the tide to be a long wave phenomena having harmonic constituents. The charts may be used to check analysis results of short sets of observations at temporary gauging sites (gross errors in recordings or time-keeping may be picked up by plotting the analyzed values on the appropriate charts). They also assist the designation of areas in which tidal coverage is inadequate and further exploration is needed. A tide of good semidiurnal character requires only one chart (M2) to yield a good estimate, of mean tide amplitude at a given site, and of the mean time of high/low water. A correctly-drawn cotidal chart reveals the structure of the tidal wave of the given frequency in the basin under consideration. Such charts may be used to predict tide in a particular area, and help control the results of numerical modeling of the ocean tide. Mathematical treatment is discussed in 33 equations. The charts show the tidal regime in all ocean waters adjacent to Canada, and the effective response of these waters to tide in the neighboring oceans. (Zielinski-IPA)

TIDAL RESPONSE IN ESTUARIES,
National Research Council of Canada, Ottawa (Ontario). Hydraulics Lab.
D. Prandle, and M. Rahman.
Journal of Physical Oceanography, Vol 10, No 10, p 1552-1573, October, 1980. 13 Fig, 2 Tab, 14 Ref.

Descriptors: *Tides, *Tidal streams, *Estuaries, Water level fluctuations, Barriers, Friction, Equations, Tidal waters, Rivers, *Tidal hydraulics.

A new general theory of tidal response in estuaries was developed which enables the complete spectral response of an estuary to be determined from just two parameters. These parameters are: an estuarine shape parameter which is dependent on the rate of change of both breadth and depth, and a dimensionless length parameter which is representative of estuarine length. Tidal amplitudes generally increase toward the head of an estuary until the effects of friction, freshwater flow, and nonlinear phenomena predominate, or the progressive truncation of the channel section stops. The gross features of channel geometry seem to determine tidal amplification. The effect of tidal barriers was also examined, with emphasis on the location of a tidal barrier. The maximum change in tidal amplitudes due to barriers rarely exceeds 10%, with increases at nodes and decreases at antinodes. In many estuaries friction was found to play a dominant role in determining tidal amplification. A useful feature of this theory is the fact that for any location, the dimensionless parameter is directly related to tidal frequency. As examples of the application of the theory, tidal responses are examined in the following estuaries: Fraser, Rotterdam Waterway, Hudson, Potomac, Delaware, Miramichi, Bay of Fundy, Thames, Bristol Channel, and St. Lawrence. (Small-FRC)
W81-02631

A STUDY OF TIDAL ENERGY DISSIPATION AND BOTTOM STRESS IN AN ESTUARY,
New Hampshire Univ., Durham. Dept. of Earth Sciences.
W. S. Brown, and R. P. Trask.
Journal of Physical Oceanography, Vol 10, No 11, p 1742-1754, November, 1980. 11 Fig, 2 Tab, 18 Ref.

Descriptors: *Mathematical models, *Estuaries, *Tidal energy, Channels, Tidal hydraulics, Stress, Momentum equation, Energy dissipation, Water pressure, New Hampshire, Great Bay.

A method for determining an area-averaged bottom stress and energy dissipation rate in a tidal estuarine channel was developed. A model of the one-dimensional continuity and momentum relations is presented which uses assumptions appropriate for a well-mixed shallow and narrow estuary. The finite difference form of these relations is derived for a section of the Great Bay estuary in New Hampshire, an estuary with a relatively large energy dissipation rate. Time series of all important first- and second-order terms in the momentum equation are estimated using a set of current, bottom-pressure, and sea-level measurements from Great Bay. The instantaneous first-order balance existed between the surface-slope-induced pressure gradient and bottom-stress forces except for slack water. The inertial and convective acceleration terms yield important second-order contributions to balance. Estimated terms are summed to infer time series of bottom stress. For Great Bay, the 14-day rms bottom stress was 45.1 plus or minus 4.5 dyn per sq cm with a corresponding rms and mean dissipation rate of 3526 plus or minus 420 and 2478 plus or minus 297 ergs per sq cm per sec, respectively. 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

NATIONAL SURVEY OF WATER AND WASTE WATER DESALTING PLANT OPERATOR CERTIFICATION PROGRAMS,
National Water Supply Improvement Association, Ipswich, MA.
G. L. Elser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185308, Price codes: A02 in paper copy, A01 in microfiche. Completion Report for the Office of Water Research and Technology, December 15, 1980. 4 p, 1 Append. OWRT-C-00166-D(No 0468)(1), 14-34-0001-0468.

Descriptors: *Desalination plants, *Desalination, *Water supply, Water purification, Training, *Surveys, Evaluation, Desalination wastes, Industrial plants, Treatment facilities, Separation techniques, Water treatment, Engineering education, Schools(Education), Analysis, Assessments, Waste water treatment, Water reuse, Quality control, Water quality.

A State-by-State survey was conducted in an attempt to determine the extent that State water and waste water treatment operator certification programs incorporate desalting within the other elements of water sciences. All 50 States, the Virgin Islands and Puerto Rico were mailed questionnaires, with 85% (44) responding. Information was obtained by telephone from the remaining eight States. The results of this survey have been summarized. The survey indicated a national lack of awareness in the increasing use of desalting technology for water and waste water treatment. Only five responses (10%) stated that desalting was included in their present certification programs. Three States indicated intent for desalting qualifications inclusion in the immediate future. The remaining States (87%) had neither reference to desalting nor any plans for its addition in the immediate future. There is a definite need to increase awareness of State certification agencies on the growing importance of desalting expertise for operators of water and waste water facilities, due to the increasing development of domestic waste water and industrial desalting plants in the United States. (Zielinski-IPA)

LIGHT-DRIVEN WATER DESALINIZATION THROUGH ARTIFICIAL MEMBRANES CONTAINING BACTERIORHODOPSIN,
California Univ., San Francisco. School of Medicine.
J. I. Korenbrot.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184152, Price codes: A06 in paper copy, A01 in microfiche. Final Report, (1981). 113 p, 22 Fig, 4 Tab, 116 Ref, 2 Append. OWRT-S-0120(No 8511)(1), 14-34-0001-8511.

Descriptors: *Desalination processes, *Desalination apparatus, *Membrane processes, Membranes, *Proteins, Films, Thin films, Water treatment, Treatment, Separation techniques, Water purification, Water sources, Desalination, Research and development, Biological membranes, Electro-osmosis, Light intensity, Aquatic environment, Light.

This study sought to develop technology to produce membranes that would incorporate the biological protein bacteriorhodopsin, a light-activated proton transporter, for operation as light-driven water desalting systems (by coupling the flux of protons to a counter-flux of cations and anions). Incorporation of the protein was successful, using a new and unorthodox method. Planar membrane films were formed by sequential transfer of two air-water interface films onto a thin hydrophilic electrically-conductive support cast from nitrocellulose. One of the films consisted of non-overlapping single-sheet membrane fragments (purple membrane) containing the protein; the second film consists of a phospholipid monolayer. Planar membranes produced by assembly of the interface films are easily accessible to electrical measurements and control of the ionic milieu on either membrane side. Illumination of these films produces photocurrents/voltages and pH changes in the milieu. Photocurrent amplitude, linearity of increase with light intensity, transport stoichiometry (protons/absorbed photon), and P-31 NMR of phospholipid in the purple membrane were evaluated and reported. (Zielinski-IPA)

3C. Use Of Water Of Impaired Quality

WATER QUALITY CHARACTERISTICS AND PHYSIOLOGICAL RESPONSES OF FISH HELD IN RECIRCULATING SYSTEMS,
Memphis State Univ., TN. Dept. of Biology.
K. B. Davis, and B. A. Simco.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189870, Price codes: A03 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center, University of Tennessee, Knoxville Research Report No 69, December, 1978. 40 p, 13 Fig, 6 Tab, 42 Ref. OWRT-B-036-TENN(1), 14-34-0001-7188.

Descriptors: Ammonia, Calcium, Catfish, Fish culture, Stress, Toxicity, Urine electrolyte excretion, *Water quality, *Recirculated water, *Fish physiology, Osmoregulation, Plasma electrolytes, Recirculating raceways.

Lethal and sublethal concentrations of ammonia and salinity for channel catfish held in recirculating systems were studied in relation to environmental calcium levels. Environmental calcium had no effect on the renal excretion of water or of any electrolytes except calcium. Plasma and muscle electrolytes from fish acclimated to fresh water or 7.5 g/liter sodium chloride were similar, but electrolyte levels increased dramatically in fish acclimated to 11 g/liter sodium chloride at both 10 and 23C. No influence of environmental calcium was observed when fish were acclimated to sublethal salinities. Addition of calcium reduced mortalities in fish exposed to normally lethal salinities. Lethal concentrations of total ammonia were found to vary dramatically with pH, and to be dependent primarily on the concentration of the un-ionized form. Ammonia toxicity was decreased by increasing environmental calcium of the test water. Ammonia toxicity was reduced for fish in isonatremic water for 24 hours. Since plasma sodium levels of ammonia exposed fish in fresh water tests were lower than controls, an osmoregulatory disturbance is suggested as one mechanism of ammonia toxicity. These results stress the importance of understanding interactions of water characteristics when determining toxicity of ammonia and possibly many other substances.

SEAWATER COOLING TOWER SHOWS FEW PROBLEMS IN FIVE YEARS,
R. McGee.
Power Engineering, Vol 85, No 2, p 66-67, February, 1981. 2 Fig.

Descriptors: *Sea water, *Cooling towers, *Powerplants, *Electric powerplants, Water cooling, Cooling water, Atlantic City, New Jersey, Structures, Corrosion.

The first seawater natural draft cooling tower in the U.S. has been in operation at the Atlantic City Electric Company's B. L. England Station for 5 years. Few problems have been experienced, and these were readily corrected. Occasionally, persistent, high, on-shore winds caused salt spray to fall on a 138 kV switchyard downwind of the tower. A screen of large vertical louvers was installed around the base of the tower to protect switchyard equipment from salt buildup. When spray nozzles made of PVC began to crack after 4 years' service, all 2,000 nozzles were replaced. Loosened support rods for splash plates were replaced by stronger stainless steel rods. The tower cools the water to 94.2F, lower than the designed 95.2F. Salt water drift measuring equipment monitors drift rate. No scale buildup or pothole formation in the concrete structure has been observed. All construction joints are coated with epoxy and exposed hardware is made of Monel or stainless steel. (Cassar-FRC)

MARINE BIOTECHNOLOGY AND THE USE OF ARID ZONES,
Commonwealth Scientific and Industrial Research Organization, South Melbourne (Australia). Div. of Chemical Technology.
D. L. Regan.
Search, Vol 11, No 11, p 377-381, November, 1980. 5 Fig, 1 Tab, 13 Ref.

Descriptors: *Phytoplankton, *Saline water, *Arid lands, *Impaired water use, Cultivation, Algae, Nutrients, Waste water treatment, Sea water, *Australia, Ponds, Microorganisms, Marine algae, Marine microorganisms, Mine water.

Cultivation of salt-tolerant phytoplankton and other microorganisms, which is possible in the arid, sunny coastal lands of Australia, may have many useful commercial applications. By controlling the salinity, temperature, nutrients, concentration of particular ions, and dimensions of a pond, desired organisms may be cultivated. Examples are Spirulina and Dunaliella for dried algal material to be used as food or as a source of vitamins, pigments, unsaturated fatty acids, and glycerol. Some phytoplankters produce pharmacologically useful products such as antibiotics, growth regulators, and many others. Fish and shellfish farming may use phytoplankton as a food source. Gums and other polysaccharides with uses in the food industry and in secondary oil recovery have been produced from Xanthamonas campestris. An unexpected application of this technology is recovery of metals from low-grade ores by bacterial leaching and concentration of metals from dilute solutions. Some phytoplankton cultivation techniques have used sewage or seawater–sewage mixtures as sources of nutrients. (Cassar-FRC)
W81-02570

UTILISATION OF SEWAGE SLUDGE ON LAND--THE CADMIUM ANGLE.
Water Services, Vol 84, No 1018, p 717-718, December, 1980. 1 Tab, 2 Ref.

Descriptors: *Sewage sludge, *Cadmium, *Sludge disposal, *Soil amendments, Metals, Heavy metals, Ultimate disposal, Fertilizers, Agricultural chemicals, Absorption, Soil contamination, Path of pollutants, *Impaired water use.

In the United Kingdom current research on cadmium in sludge-treated soil concerns transfer into crops and the food chain. It is important to maintain pH near neutral and avoid Cd accumulating plants, such as lettuce, in soils with excessive metal levels. Cd is most available to crops during the first 6 months after application. This refutes the theory that Cd is chelated and may be released later in massive doses. Sludge containing an average of 20 mg per kg Cd adds 0.04 to 0.08 kg per hectare per year when applied at 2-4 tons per hectare per year dry solids. The maximum recommended level is 0.167 kg per hectare per year. (Cassar-FRC)

SEWAGE SLUDGE HYGIENISATION PLANT SUPPLIES FERTILISER,
Sulzer Bros. Ltd., Winterthur (Switzerland).
O. Luscher.
Water Services, Vol 84, No 1018, p 711-713, December, 1980. 2 Fig, 1 Tab, 2 Ref.

Descriptors: *Irradiation, *Gamma rays, *Sludge treatment, Sterilants, Sewage sludge, Public health, Microorganisms, Viruses, Bacteria, Ultimate disposal, Sludge disposal, Soil amendments, Fertilizers, Animal parasites, Radiation, Waste treatment, Cobalt radioisotopes, Radioisotopes.

Gamma irradiation from a cobalt-60 source has been used since 1973 in a sewage sludge plant in Geiselbullach, Germany, for destroying bacteria, viruses, and parasites so that the sludge would be more desirable as a fertilizer for agricultural land. The plant averages a throughput of 100 cu meters of sewage sludge daily, although rates up to 200 cu meters daily are possible by increasing the source activity. The radioactive source is recharged about once a year. Total costs range from 15.42 DM per cu meter for a 30 cu meter daily throughput to 4.47 DM per cu meter for 150 cu meters per day. Sludge produces no unpleasant odors and is more easily dewatered (53% water versus 78% for non-irradiated sludge). Gas produced in digestion is used to run fans and heat digested sludge. Although salmonellae are present in many sludges applied to agricultural land, irradiated sludge has none. Coliforms decreased, and desirable soil bacteria either increased upon storage or were not adversely affected. Viruses, present in 5% of sludge samples, decreased by a factor of 10 after irradiation. Worm eggs were damaged irreversibly. Irradiated sludge remained almost odorless upon application to fields, unlike thermally pasteurized material. Fields could be worked after only 8 days, compared with 15 days for unirradiated sludge. (Cassar-FRC)

3D. Conservation In Domestic and Municipal Use

MUNICIPAL WATER USE IN NORTHERN COLORADO: DEVELOPMENT OF AN EFFICIENCY-OF-USE CRITERION,
University of Colorado, Boulder.
A. U. White, A. N. DiNatale, J. Greenberg, and J. E. Flack.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185365, Price codes: A07 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University, Fort Collins, Completion Report No 105, September, 1980. 123 p, 17 Fig, 40 Tab, 27 Ref, Append. OWRT-A-042-COLO(1), 14-34-0001-9006 & 0106.

Descriptors: Conservation, *Water conservation, *Water use efficiency, *Water demand, *Municipal water, *Colorado, Water supply, Social aspects, Water rights, Return flow, *Water metering, Water resources development, Pricing, Water reuse, Northern Colorado cities, Water saving devices, Restrictions, Survey research, Consumer attitudes.

Water shortages, costs of treatment and rapid growth impose severe pressures on urban water utilities, especially those serving smaller cities and towns. In this study of more than two dozen Northern Colorado towns data was acquired on residential water use and the attitudes and perceptions of water officials and managers with regard to water conservation and meeting future demands. In addition, a random mail survey was made of water customers of selected towns to assess the consumers' attitudes toward various water conservation programs and how shortages should be met. The results of this three-pronged effort permitted a comparison of managers' attitudes with those of consumers leading to various recommendations for development of water conservation programs that would be implementable. Recommendations for long-range conservation include universal metering, development of new supplies and water rights, requirements for low-flow devices and native vegetation in new housing areas, increasing block pricing, public education, reuse of water for non-drinking purposes, and possibly restrict growth. Drought contingency plans are a priority need and should include (1) public education of drought and its consequences, (2) installation of water saving devices, (3) implementation of restrictions and allotments, and (4) surcharges on prices for metered services.

3E. Conservation In Industry

INDUSTRIAL WATER CONSERVATION WITHIN THE GREAT LAKES REGION: AN OVERVIEW,
Great Lakes Basin Commission, Ann Arbor, MI.
L. B. Antosiak, and C. A. Job.
Journal of the American Water Works Associ-

ation, Vol 73, No 1, p 9-12, January, 1981. 2 Tab, 12 Ref.

Descriptors: *Great Lakes, *Water conservation, *Industrial water, Regulations, Conservation, *Water reuse, Water utilization, Cooling water, Water consumption.

Although water in the Great Lakes area is relatively abundant and cheap, industries are recycling and reusing water to save capital and operating costs. Incentives for industry to conserve water are waste water treatment regulations, pricing policies, and sewer surcharges. Two cases are described in which water conservation saved companies $3 million annually. Factors which discourage water conservation are nonproductive cost of alterations to equipment, failure to enforce regulations, increasing energy costs, and the question of environmental benefits versus costs. Decisions on industrial water conservation must be made on a case by case basis. (Cassar-FRC)
W81-02633

3F. Conservation In Agriculture

IMPACT OF AVAILABILITY OF WATER AND COST OF ENERGY INPUTS ON AGRICULTURAL PRODUCTION IN THE OKLAHOMA PANHANDLE,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Economics.
H. P. Mapp, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185241, Price codes: A04 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University Completion Report, September, 1980. 63 p, 2 Fig, 17 Tab. OWRT-A-085-OKLA(1), 14-34-0001-9038.

Descriptors: *Water supply, *Water demand, *Cost analysis, *Energy, *Crop production, Agriculture, Water distribution(Applied), Water utilization, Analysis, Costs, Economics, Cost comparisons, Model studies, Estimating, Research and Development, Testing, Forecasting, *Oklahoma.

The study analyzed the economic life of the underground water supply in the Oklahoma Panhandle under two basic sets of assumptions/scenarios. In scenario I, relative prices of inputs and outputs were assumed constant, and the effects of declining water supply on irrigation well yields, pumping costs, and the pattern of irrigated and dryland crop production in the study area were evaluated; the regional linear programming model developed for this analysis selected the dryland-irrigated crop activities combination that maximized net returns to region producers subject to a set of constraints (including projected region production levels). In scenario II, natural gas price was assumed to increase 2%/year relative to prices of other inputs and outputs, and was designed to determine the potential impact of the rising real price of natural gas over the coming years. Solutions of the scenario I model depict a gradual conversion from irrigated to dryland production, with irrigated wheat projected to increase during 1985-89 and gradually decrease thereafter. Under scenario II, irrigated wheat production is projected to decrease steadily to zero by the 2000-09 period. Eventual economic exhaustion of the aquifer appears inevitable unless dramatic increased output price or institutional/technological changes occur. (Zielinski-IPA)

ASSURING SUSTAINED IRRIGATION IN THE NORTHERN GREAT PLAINS BY SOIL-WATER INTERACTION STUDIES,
South Dakota State Univ., Brookings. Water Resources Inst.
C. G. Carlson, J. H. Bischoff, L. O. Fine, and M. H. Sanders.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185258, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, January, 1981. 63 p, 10 Fig, 3 Tab, 11 Ref, 2 Append. OWRT-B-053-SDAK(2), 14-34-0001-8117.

Descriptors: *Irrigation practices, *Great Plains, *South Dakota, *Soil-water-plant relationships, *Electrical conductance, Water properties irrigation, Geographical regions, Aquifers, Regions, Irrigation efficiency, Irrigation effects, Earth-water interfaces, Salinity, Soil water, Moisture, Subsurface waters, Moisture availability, Soil environment, Nature of water, Conductivity.

Many of South Dakota's aquifers contain vast quantities of water, but much of this is (by accepted standards) classified as having high salt and/or sodium hazard. Further, application of these standards (established under acid conditions on soils dissimilar to South Dakota) to South Dakota climate and soil conditions is somewhat suspect. To improve our predictive capability regarding irrigation operation, a broad evaluation of existing irrigation systems was needed. From the broad soil sampling program undertaken, it was apparent that the electrical conductivity (EC) of the soil saturation extract (EC-e) is difficult to predict. The most significant factor determining the EC-e is the EC of the water. Other non-analyzed factors (e.g., soil internal drainage) also contribute to EC-e variability. Only at isolated sites probably inappropriate to irrigation is the total soil salt load considered high enough to cause great concern. Sodium is of greater concern. Results indicate that irrigated field exchangeable sodium percentages (ESP) can be predicted more accurately than EC-e levels, but more refinement/understanding is still needed. The most dangerous present deficiency is inability to predict dispersion and hydraulic conductivities, given a particular ESP and soil type. (Zielinski-IPA)

WATER SYSTEMS AUTOMATION AND MANAGEMENT, PART 2,
D. F. Nelson.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 2-2, p 1-26. 14 Fig.

Descriptors: *Irrigation systems, *Irrigation efficiency, *Irrigation engineering, *Automation, Water management(Applied), Water control, Flow control, Remote control, Reservoirs, Irrigation canals, Water loss, Seepage, Control systems.

More efficient use and better management of irrigation water can reduce water losses and so make more water available for municipal, industrial, and recreational uses now and in the future. Automatic and remote controls are needed for water storage and conveyance systems to improve service to water users, increase efficiency of operation, and reduce cost of operation. The discussion of the need for automation includes descriptions of the functions of various water control structures as they apply to the segments of the total system. The structures include outlet works, spillways, diversion dams and structures, pumping plants, canal checks, pipe systems, turnouts, and wasteways. Upstream control, downstream control, or controlled volume operation may be used to control water supplies. Feedback control and remote control methods offer scope for automation. Basic feedback control systems are designed to return a portion of the output signal to the input of a controller to maintain a prescribed relationship between input and output signals and may be achieved by one of five common modes of control: two-position control; floating control; proportional control; reset action; and rate action. Remote control may be performed manually or by computer. Both methods can be applied to open channel and pipe systems. (Brambley-SRC)

WATER SYSTEMS AUTOMATION AND MANAGEMENT, PART 3,
M. McVay.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 2-3, p 1-13. 4 Tab.

Descriptors: *Irrigation systems, *Irrigation efficiency, *Water management(Applied), Automation, Computers, Water resources, Water districts, Agriculture, Competition, Economic efficiency, Distribution systems, Irrigation districts, Environmental effects.

Increasing demands made on the water resources of the western United States require better water utilization by the agricultural sector. The Water and Power Resources Service has developed tools to enhance irrigation district operations. The Irrigation Management Services Program involves over 171,000 acres in 20 water districts in eight western states, improving irrigation scheduling. Onfarm field irrigation scheduling and distribution system scheduling can be used by districts to improve grower yields and crop quality, lower production costs, lower district operation and maintenance costs, improve criteria for planning and development of future needs, and obtain more favorable environmental impacts. Both scheduling systems may be computer based using irrigation guide, field irrigation schedule, district wide irrigation requirement program or gravity system scheduling systems. Typical computer print-outs for each system are presented. Coordinating water deliveries throughout distribution systems can increase the efficiency of water use. (Brambley-SRC)

CANAL LININGS AND SOIL SEALANTS,
W. R. Morrison, and H. Johns.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 7-1, p 1-33. 26 Fig, 2 Tab, 16 Ref.

Descriptors: *Soil sealants, *Canal linings, *Irrigation engineering, *Water conservation, *Seepage control, Irrigation systems, Impervious membranes, Concretes, Concrete-lined canals, Asphaltic concrete, Plastics, Synthetic rubber, Water loss.

Conservation of water becomes increasingly important in the western United States as water demands on limited supplies increase. Seepage control in irrigation systems is a prime conservation measure. Lining of canals or placing in pipe has been the policy of the Water and Power Resources Service since 1967. Linings can be classified as compacted earth, hard-surface, and buried or exposed membrane types. Factors to be considered in selecting a lining type include soil type, canal operating capacity and flow velocity, structural stability requirements, water quality, safety requirements, and maintenance needs. The advantages and disadvantages of the hard-surface linings - portland cement concrete and mortar, asphaltic concrete, and soil-cement - are discussed. The disadvantages of exposed membranes are such that they have been used only on an experimental basis. Buried membranes may be asphalt, polyvinyl chloride, polyethylene or synthetic rubber. Subgrade preparation and cover materials for these membranes are discussed. Some soil sealants and methods of seepage measurement are described. (Brambley-SRC)

FEASIBILITY OF IRRIGATING WITH WATER FROM SCS FLOODWATER-RETARDING IMPOUNDMENTS,
Science and Education Administration, Chickasha, OK.

R. R. Schoof, and H. Price.
Agricultural Reviews and Manuals ARM-S-12, October, 1980. 9 p, 3 Fig, 2 Tab, 6 Ref.

Descriptors: *Flood-control storage, *Supplemental irrigation, *Oklahoma, Irrigation water, Drought, Water resources development, Water storage, Water loss, Water rights, *Irrigation programs.

Droughts during the summer growing season are frequent in western Oklahoma. Where enough water of suitable quality is available, irrigation can increase production, stabilize income, and eliminate the possibility of forced sale of livestock during an extended drought. The use of water for supplemental irrigation was inventoried at 16 Soil Conservation Service (SCS) floodwater retarding impoundments in a 1,130 square mile reach of the Washita River in southwestern Oklahoma in 1977. Nearly 500 acre-feet of water was applied to over 800 acres during the growing season. All of the farmers involved in the study reported that there had been enough water for the acreage under irrigation. Calculations revealed that in 136 completed floodwater-retarding impoundments within the study reach, there were more than 13,000 acre-feet of potential water storage in sediment pools. When water was released from one impoundment on each of two streams at initial rates of 6.8 and 1.17 cubic feet per second to determine transmission losses, 75 and 44% of the water reached gaging stations 6 and 4.5 miles downstream. A landowner must own part of the flood pool, dam, spillway, or sediment pool to obtain the legal right to use part of the water. (Moore-SRC)

SPRINKLER HEAD WITH AN IMPROVED SLOTTED DRIVE SPOON,
Nelson (L. R.) Corp., Peoria, IL. (Assignee).
K. J. Brunninga.
U.S. Patent No 4,205,787, 7 p, 3 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 995, No 1, p 141, June 3, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Application equipment, Irrigation efficiency, Irrigation practices, Irrigation operation and maintenance.

A step-by-step rotary sprinkler head has an impact arm with a drive spoon. The drive spoon is of the anti-backsplash type and includes a pull-in reactant surface and a drive-out reactant surface spaced raially and laterally outwardly of the pull-in reactant surface. The pull-in reactant surface has a slot formed in the central portion for enabling a portion of the stream issuing from the sprinkler head outlet to continue its movement into the slot and outwardly without being deflected onto the drive-out surface when the drive spoon is in stream engagement so that the reactant force established on the drive-out surface is reduced in relation to that which would be established by the deflection of the entire stream. (Sinha-OEIS)
W81-02629

SPRINKLER HEAD WITH IMPROVED COMBINED STREAM COHERENCY DIFFUSER AND DISTANCE CONTROL BAFFLE MEMBER,
Nelson (L.R.) Corp., Peoria, IL. (Assignee).
K. J. Bruninga.
U.S. Patent No 4,205,788, 5 p, 4 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 995, No 1, p 141, June 3, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Application equipment, Irrigation efficiency, Irrigation practices, Irrigation operation and maintenance.

An object of the invention is to provide a combined baffle and diffuser structure which gives the sprinkler the ability to achieve the functional variations heretofore provided by both an adjustable diffuser pin and an adjustable baffle, while at the same time maintaining the reduced radial dimension heretofore provided in baffles of reduced size utilized to replace the diffuser pin. This object is obtained by providing a combined stream coherency diffuser and distance control baffle member which includes an arm portion placed generally vertically having an aperture extending horizontally through one end, a baffle portion extending at generally right angles from the opposite end of the arm portion and a relatively small diffuser portion extending at generally right angles from the free edge of the baffle. The combined stream coherency diffuser and distance control baffle is mounted on the sprinkler body by a pivot assembly. The combined member is stamped from sheet metal, the baffle portion and diffuser portion being bent in relation to the arm portion. A manual engaging tab is also provided as an integral bent portion of the sheet metal for enabling the member to be readily moved into any desired position of adjustment. (Sinha-OEIS)

RELATION BETWEEN PROPOSED DEVELOPMENTS OF WATER RESOURCES AND SEEPAGE FROM THE ALL-AMERICAN CANAL, EASTERN IMPERIAL VALLEY, CALIFORNIA,
Geological Survey, Tucson, AZ. Water Resources Div.
O. J. Loeltz, and S. A. Leake.
Geological Survey Open-File Report 79-744 (WRI), May, 1979. 83 p, 26 Fig, 1 Tab, 7 Ref.

Descriptors: *Water resources development, *Canal seepage, *Computer models, *California, *Mexico, Surface-groundwater relationships, Streamflow, Water wells, Pumping, Water levels, Aquifer characteristics, Groundwater movement, Groundwater recharge, Forecasting, *Eastern Imperial Valley, *Mexicali Valley, All-American Canal.

A two-layer digital model designed for this study indicated that sealing of the Coachella branch of the All-American Canal would cause an eventual increase in seepage from the All-American Canal of about 15,000 acre-feet annually. Sealing of both the Coachella Canal and the segment of the All-American Canal between Pilot Knob and Drop 1 would result in a lessening of seepage rates from the All-American Canal of 57,000 acre-feet in 1985, but of only 39,000 acre-feet in 2030. Sealing both the Coachella and the All-American Canals would reduce the outflow to Mexicali Valley from 120,000 acre-feet in 1980 to less than 9,000 acre-feet in 2030. The model also indicated that if only the Coachella Canal was sealed, a little less than 40% of water pumped from proposed well fields near the All-American Canal ultimately would be derived from increased seepage from the All-American Canal; between 50 and 60% of the water pumped would be water that otherwise would flow to Mexicali Valley. Descriptors: *Reservoir operation, *Low-flow augmentation, *Water levels, *Computer models, *Wisconsin, Simulation analysis, Streamflow, Inflow, Discharge(Water), Precipitation(Atmospheric), Evaporation, Forecasting, Water management(Applied), *Lake Winnebago(WI), Fox River(WI), Wetland preservation.

Three proposed operation plans for the Winnebago pool, Wis., were studied to determine the effects on lake stage and discharge. A digital reservoir simulation model simulated daily lake stage and discharge from the Winnebago pool. Inflow for this simulation was computed from daily discharge, recorded at Rapide Croche Dam, and daily stage, recorded at Oshkosh. This computed inflow is net inflow, combining the effects of streamflow, precipitation, evaporation, and net groundwater inflow. The model adjusted discharge daily to keep lake stage close to the proposed operation plan. By doing this and by lowering the pool level to near the minimum stage in winter, the plan reduced the frequency of stages exceeding the maximum allowed stage. For the 61 years simulated (water years 1918-78), the simulated 7-day, 10-year low flow at Rapide Croche Dam was 1,000 cubic feet per second compared to 900 cubic feet per second for the observed record. The 7-day, 2-year low flow was 1,500 cubic feet per second (simulated) versus 1,600 cubic feet per second (observed). The study showed that discharge from the Winnebago pool could be managed to guarantee a release of up to 1,500 cubic feet per second, but with occasional violations of the minimum stage requirement. WATER RELATED PROBLEMS IN THE COASTAL ZONE OF LOUISIANA,
Louisiana State Univ., Baton Rouge.
R. F. Malone, M. E. Tittlebaum, S. M. Crane, N. S. Sanders, and S. R. Alston.
Louisiana Water Resources Research Institute Technical Report No 7, November, 1980. 155 p, 5 Fig, 3 Tab, 165 Ref. DACW-29-79-C0268.

Descriptors: *Coasts, *Coastal structures, *Channels, *Wetlands, *Watersheds(Basins), *Louisiana, Water resources, Water control, Aquatic plants, Water utilization, Flooding, Wildlife conservation, Dredging, Navigation, Erosion, Saline water intrusion, Subsidence, Water quality, Waste supply, Recreation.

Significant water and related land resources problems were identified and solutions identified and evaluated. The coastal zone was subdivided into nine hydrologic units based primarily on the topography and drainage patterns within them. Thirteen problem areas were identified: aquatic weed growths; conservation of fish and wildlife; flooding; maintenance dredging; navigation; saltwater intrusion; shoreline and beach erosion; subsidence; urban and industrial expansion; water quality; water related recreation; water supply for municipal and industrial use; and wetlands deterioration. For each hydrologic zone, the parishes affected by each problem were identified from published and unpublished reports and other sources. Generalized solutions identified and evaluated for these problems include: for aquatic weed growths - biological, chemical and mechanical controls and habitat manipulation; for flooding - levees, floodwalls, seawalls, channel construction and improvements, pumping stations and non-structural controls; for navigation - new or modified channels; for saltwater intrusion - freshwater diversion, blocking of access canals, saltwater barriers, pumping restrictions, artificially recharging aquifers, and injection of freshwater along a freshwater-saltwater interface; for sedimentation of aquatic habitat - dredging, directional drilling, pipeline installation, corridors, restoration of natural flow patterns, elimination of lateral canals and channelization; for shoreline and beach erosion - revetments, rip-rap, artificial nourishment, groins, jetties, seawalls and bulkheads, breakwaters, levees and revegetation; for subsidence - restricting urban development and land drainage and construction regulations; for urban and industrial expansion - development, construction and zoning practices.

Each solution will have cumulative impacts and associated effects. Their negative aspects can be minimized by the application of non-structural or management techniques, and adherence to the proposed state guidelines for protection of the coastal zone. (Brambley-SRC)

VEGETATION MANAGEMENT AND PEST CONTROL,
F. Oliver, G. Hansen, G. Otto, and F. L. Nibling.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Sessions 12-1 and 12-2, p 1-43. 15 Fig.

Descriptors: *Irrigation systems, *Vegetation effects, *Pest control, *Aquatic animals, *Aquatic weeds, Herbicides, Pesticides, Aquatic plants, Pipelines, Mechanical control, Water distribution(Applied), Weed control, Regulations.

Irrigation systems require management of land weeds, aquatic weeds, and invertebrate animals for the system to function efficiently. All may be managed by preventive, control or recovery methods. Control of land weeds with herbicides is the most common method. The factors influencing herbicide effectiveness include plant factors, environmental factors, and herbicidal factors. The administration of a weed program is discussed and the laws and regulations affecting the use of pesticides are presented, with examples of the consequences of misuse. Control of aquatic weeds is complicated by difficulty of controlling a herbicide in water, and the multiple use interests to be considered. Chemical methods are generally preferred over mechanical methods. Invertebrate animals are problems in both open and closed systems. Sponges, bryozoans, mollusks, and insects in large infestations may significantly reduce water flow or even block pipes. (Brambley-SRC)

PROPOSED MODEL POLICIES FOR URBAN DRAINAGE MANAGEMENT.
Canada-Ontario Agreement on Great Lakes Water Quality, Research Program Project No 77-1-47. Research Report No 102, 1980. 51 p, 2 Append.

Descriptors: *Water policy, *Urban drainage, *Urban planning, *Water management, *Drainage programs, Drainage area, Surface runoff, Runoff, Public policy, Drainage, Planning, Community development, Regional development, Municipal water, Drainage systems, Drainage practices, Drainage, Drainage effects, Drainage density, Sewers, Surface drainage, Water quality control, Erosion.

The Urban Drainage Policy Committee was formed in 1977 to propose model policies for controlling flooding, pollution and erosion problems resulting from urban drainage. In the course of this research, five policy proposals were developed and described in detail, covering: (1) municipalities, in coordination with the conservation authorities, should develop master drainage plans for all watersheds within their boundaries; (2) municipalities with sewage collection and treatment systems should formulate and implement a comprehensive pollution control strategy that considers both wet and dry weather pollution sources; (3) drainage systems for all new development should be designed using the major-minor concept, which recognizes the drainage system's dual role of providing convenience during minor (high frequency) runoff events and minimizing property damage and protecting life during major (rare) runoff events; (4) proponents of new urban developments should indicate the effects of the development on the watershed and carry out mitigative measures as required; and (5) proponents of new urban developments should plan for and carry out an erosion and sediment control program in the planning and construction stages of development, and follow this with an adequate maintenance program. APPRAISAL OF POTENTIAL FOR INJECTION-WELL RECHARGE OF THE HUECO BOLSON WITH TREATED SEWAGE EFFLUENT--PRELIMINARY STUDY OF THE NORTHEAST EL PASO AREA, TEXAS,
Geological Survey, Austin, TX. Water Resources Div.
S. Garza, E. P. Weeks, and D. E. White.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.50 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 80-1106, September, 1980. 38 p, 6 Fig, 4 Tab, 13 Ref, 1 Plate.

Descriptors: *Artificial recharge, *Treated water, *Sewage effluents, *Injection wells, *Texas, Water reuse, Aquifer characteristics, Water levels, Water quality, Computer models, Methodology, Chemical analysis, *Hueco bolson, *El Paso.

The U.S. Geological Survey, in cooperation with the Texas Department of Water Resources, made a preliminary study of specific factors related to recharging the Hueco bolson in the northeast El Paso area with treated sewage effluent. The city is interested in the location and spacing of injection wells relative to (1) maintaining the injected effluent in the aquifer for a predetermined amount of time (residence time) before it is pumped out, (2) recovery by pumping of as much of the injected effluent as possible, and (3) the long-term effects of injection on water-level declines. A two-dimensional digital-computer model was developed to project short-term hydraulic gradients under various conditions of pumping and injections. A corresponding range of interstitial velocities (294-773 feet per year) was estimated by assuming idealized piston-type flow. These velocities may be used to plan the location and spacing of production and injection wells under assumed time factors related to the required residence time for the injected water. The injection sites were selected near a proposed sewage-treatment facility in an area that will allow flexibility in the locations of the production and injection wells. Maximum 20-year declines of about 35 feet were projected for areas several miles west and southwest of the facility under anticipated injection and pumping rates. The proposed injection water will require strict water-quality controls, which may involve chlorination and the removal of suspended solids. Mixing of the proposed injection water with the native groundwater probably will not clog the aquifer by mineral precipitation. The relatively large concentrations of sodium in the injection water may reduce the hydraulic conductivity of the clay layers in the aquifer, but the permeable sands should not be seriously affected. Plans for an artificial-recharge program need to include an experimental installation to evaluate the system under field conditions. (USGS)

SUMMARY APPRAISALS OF THE NATION'S GROUNDWATER RESOURCES--CARIBBEAN REGION,
Geological Survey, San Juan, PR. Water Resources Div.
F. Gomez-Gomez, and J. E. Heisel.
Available from Supt. of Documents, GPO, Washington, DC 20402. Geological Survey Professional Paper 813-U, 1980. 32 p, 19 Fig, 4 Tab, 51 Ref.

Descriptors: *Groundwater resources, *Virgin Islands, *Puerto Rico, *Regional analysis, *Evaluation, Water resources development, Islands, Groundwater availability, Water supply, Water quality, *Caribbean Region.

Aquifers constitute a valuable resource in the Caribbean Region. In Puerto Rico, groundwater withdrawals are estimated at 357 cubic hectometers per year or 38% of all freshwater use, excluding hydroelectric power generation. In the U.S. Virgin Islands groundwater withdrawals are estimated at 1.9 cubic hectometers per year, or 10% of all freshwater used, including desalinated seawater. Excluding desalinated water, groundwater supplies 71% of U.S. Virgin Islands needs. By 1985 it is estimated that groundwater withdrawals will increase to 430 cubic hectometers per year in Puerto Rico, and 4.5 cubic hectometers per year in the U.S. Virgin Islands. Groundwater will continue to be important in the Caribbean Region. To meet future needs it is necessary to apply effective hydrologic principles in managing the total water resource (surface and subsurface supplies). Only through such an approach can optimum use of the water resources be achieved. Optimum use can be accomplished through conjunctive use of surface and groundwaters and implementation of conservation practices. (USGS)

WATER RESOURCES AND GEOLOGY OF THE LOS COYOTES INDIAN RESERVATION AND VICINITY, SAN DIEGO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
A. P. Ballog, Jr., and W. R. Moyle, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $7.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-960, October, 1980. 25 p, 4 Fig, 8 Tab, 26 Ref.

Descriptors: *Groundwater resources, Hydrogeology, *Available water, *Water yield, *Indian reservations, *California, Precipitation(Atmospheric), Streamflow, Water quality, Chemical analysis, Water wells, Drillers logs, Groundwater potential, Hydrologic data, Data collections, Evaluation, *Los Coyotes Indian Reservation, *San Diego County(CA).

The water resources of the Los Coyotes Indian Reservation, San Diego County, Calif., are sufficient to supply the limited domestic and stock-water needs of the present residents of the reservation. Surface-water runoff is derived from direct precipitation on the area and from intermittent spring flow. Groundwater occurs in the alluvial deposits and in the consolidated rocks where they are highly fractured or deeply weathered. The best

potential for groundwater development on the reservation is in the small alluvial basins in the San Ysidro and San Ignacio areas. Most water on the reservation is good to excellent in chemical quality for domestic, stock, and irrigation use. Water from two wells (and one spring), however, exceeds the primary drinking-water standard for nitrate plus nitrate. (USGS)

A GEOLOGIC APPROACH TO ARTIFICIAL RECHARGE SITE SELECTION IN THE FRESNO-CLOVIS AREA, CALIFORNIA,
Science and Education Administration, Fresno, CA. Water Management Research.
D. Cehrs, S. Soenke, and W. C. Bianchi.
Technical Bulletin No 1604, January, 1980. 76 p, 62 Fig, 9 Tab, 64 Ref.

Descriptors: *Artificial recharge, *Groundwater recharge, *Site selection, *California, Computers, Groundwater basins, Sedimentary structures, Alluvial fans, *Groundwater management, Subsurface mapping, Groundwater hydrology, Well logs.

In areas of alluvial sediments, the potential for the recharge of surface waters varies with the characteristics of the sediments and the total amount of area exposed to rechargeable water. The best available geologic sites with easy access to rechargeable water and which are hydraulically above the area of need are identified and located using surface and subsurface sedimentary geology. By using cursory survey techniques on geologic and soils maps, initial areas with good surface recharge potentials can be identified. Computer averaged water well logs can be used to delineate the subsurface. This subsurface data, used in conjunction with the surface material data, will demarcate the best potential areas for basins. Some areas with poor surface potential may have excellent subsurface recharge potential and be excellent sites for recharge wells. The final siting decision should be based on the hydraulic data, as the recharge efficiency and its economic criteria are controlled by the percolation rates of the surface and subsurface strata. The alluvial geology and related hydrology of the Fresno-Clovis, California, area were studied in relation to artificially recharged water and ground water dynamics. (Moore-SRC)

GROUNDWATER MANAGEMENT WITH FIXED CHARGES,
Petroleos de Venezuela, Caracas. Exploration Dept.
E. Aguado, and I. Remson.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 375-382, July, 1980. 2 Fig, 1 Tab, 14 Ref.

Descriptors: *Installation costs, *Water management(Applied), *Groundwater management, Water wells, Drainage wells, Excavation, Planning, Hydrology, Economics, Costs, Project planning, Construction costs, Optimization, Linear programming.

In previous work groundwater variables (hydraulic head, hydraulic conductivity, discharge or recharge rate per unit area, etc.) were used in a model to determine the optimal plan for maintaining an excavation site in a dewatered state. This paper introduces the 'setup cost' or the cost of installation of the required wells into the equations. This cost is significant when the life of the project is relatively short. In a solution of a modeling study with 10 wells around an excavation site, the optimal solution (including fixed installation charges) was to use 8 wells at a 9% higher pumping rate. (Cassar-FRC)

SLOT MULCH FOR RUNOFF AND EROSION CONTROL,
Science and Education Administration, Pullman, WA.
K. E. Saxton, D. K. McCool, and R. I. Papendick.
Journal of Soil and Water Conservation, Vol 36, No 1, p 44-47, January/February, 1981. 5 Fig, 19 Ref.

Descriptors: *Cultivation, *Erosion control, *Runoff, Furrows, Crops, Mulches, Infiltration rates, Soil physical properties, Soil management, Surface sealing, Frozen soils.

A slot mulch method of tillage and residual management was developed to control erosion and runoff on land where infiltration is restricted by frost or soil characteristics. Crop residues were compacted into narrow continuous slots 2 to 4 inches wide by 8 to 10 inches deep. The soil was ridged on the down-slope side. The slot works best when installed on the contour, and the residual mulch maintained a good microporosity for water infiltration even when the soil was frozen or the surface became crusted and sealed. The slot depth was kept below the frost depth. During runoff, the water ran into the slot and down through the residue. Tests were conducted on four different runoff-erosion plots, each 12-ft wide and 73-ft long, near Pullman, Washington. The method controlled runoff and erosion to a significant extent except when the frost depth extended below the slot depth. The method could be effective on critical erosion areas such as steep slopes planted in grass or having exposed subsoil. (Small-FRC)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

DISTRIBUTION OF TRACE ELEMENTS IN A WARM WATER RELEASE IMPOUNDMENT,
Arkansas Water Resources Research Center, Fayetteville.
J. Nix.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185373, Price codes: A08 in paper copy, A01 in microfiche. Completion Report, October, 1980. 49 p, 22 Fig, 4 Tab, 12 Ref, 66 Append. OWRT-B-027-ARK(1).

Descriptors: *Water analysis, *Water quality, *Trace elements, Data collections, *Impoundments, Monitoring, Baseline studies, Turbidity, Water chemistry, Water temperature, Water properties, Basic data collections, On-site data collections, Measurement, Calcium, Dissolved oxygen, Biochemical oxygen demand, Iron, Manganese, *Arkansas, DeGray Reservoir.

The results of a detailed water quality survey conducted over 1969-1975 on DeGray Reservoir in southwest Arkansas were used to describe physical/chemical processes affecting reservoir and river system constituent concentrations. Dissolved oxygen (DO) and turbidity profiles delineated water movement through the reservoir. Development of metalimnetic DO minima appeared as related to advective transport within the metalimnion (with metalimnetic DO depletion greatest during years when Spring rains occurred after stratification onset). Dissolved oxygen data showed new reservoir 'aging' (with hypolimnetic DO depletion severe during early impoundment years, but moderated after four years). Iron (Fe) and manganese (Mn) expectedly correlated well with DO depletion; other trace metals studied did not correlate with either Fe or Mn. Cobalt correlated significantly with nickel, probably due to their geochemical similarity. Storm event intervention was the most significant factor determining concentrations of calcium and other conservative constituents. Calcium dropped as storm water entered the reservoir. Other constituents, including phosphorus and suspended solids, increased in storm water. (Zielinski-IPA)

APPENDICES FOR DISTRIBUTION OF TRACE ELEMENTS IN A WARM WATER RELEASE IMPOUNDMENT,
Arkansas Water Resources Research Center, Fayetteville.
J. Nix.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185381, Price codes: A06 in paper copy, A01 in microfiche. Completion Report, October, 1980. 103 p, 100 Append. OWRT-B-027-ARK(1).

Descriptors: *Water analysis, *Water quality, Data collections, *Trace elements, *Impoundments, Monitoring, Baseline studies, Turbidity, Water chemistry, Water temperature, Water properties, Basic data collections, On-site data collections, Measurement, Calcium, Dissolved oxygen, Biochemical oxygen demand, Iron, Manganese, *Arkansas, Lake DeGray.

This document contains 98 appendices of data on measurements taken at various designated monitoring/sampling stations for Lake DeGray in south-central Arkansas. Graphs given in appendices 2-12 show turbidity profiles over depths ranging from about 5-50 meters over five stations during May-December, 1971. Dissolved oxygen profiles are given for various test days from October 1969 to July 1974 in appendices 13-66. Appendices 2-66 also appear in the principal report document for this study (see W81-02402). The remaining appendices (67-100) are tabular data sets from stations 1, 10, and 12, generally covering depths from 0-50 meters (m), 0-25 m, and 0-15 m, respectively. Water temperature data: appendices 66-67 (1970-75); dissolved oxygen: 68 (1970-75); turbidity (percent transmission): 69 (1971-75); pH: 70 (1970-75); alkalinity: 81 (1971-75). The remaining appendices (72-100) contain tabular data on individual trace elements within the period 1970-1975 for the following elements: sodium, potassium, calcium, magnesium, silicon, ammonium ion, nitrate, orthophosphate, sulfate, fluoride, chloride, iron, manganese, copper, cobalt, nickel, zinc, lead cadmium, and arsenic. (Zielinski-IPA)

TRACE METAL CONCENTRATIONS IN SEDIMENT CORES FROM THE CONTINENTAL SHELF OFF THE SOUTHEASTERN UNITED STATES,
Geological Survey, Woods Hole, MA.
M. H. Bothner, P. J. Aruscavage, W. M. Ferrebee, and P. A. Baedecker.
Estuarine and Coastal Marine Science, Vol 10, No 5, p 523-541, May, 1980. 2 Fig, 6 Tab, 28 Ref.

Descriptors: *Trace elements, *Heavy metals, *Sediments, *Continental shelf, Baseline studies, Southeast United States, South Carolina, Atlantic Ocean, Cores, Sampling.

A baseline for 32 trace metal concentrations in sediment cores taken from the Southeast U.S. con-

tinental shelf (in the area of South Carolina from about 30 to 34 degrees latitude) was established. Metal concentrations were low and uniform with depth. There was no evidence of anthropogenic deposition, either at the water-sediment interface or at deeper levels. Small variations in metal levels were attributed to texture variations and to differing amounts of calcium carbonate and organic matter. Both long (6 meter) and short (70 cm) cores were collected, the shorter ones used to analyze the surface sediments. Cores were 99.9% sand and contained very little organic carbon. (Cassar-FRC)

WATER QUALITY CHANGES DURING DISTRIBUTION,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
A. H. Vajdic.
Ontario Ministry of the Environment Report No 81, September, 1980. 15 p, 4 Tab, 19 Ref.

Descriptors: *Water purification, *Water quality, *Water distribution(Applied), Water sources, Water wells, *Water treatment, Water analysis, Lake Ontario, Chlorination, Coagulation, Settling basins, Filtration, Baseline studies, Domestic water, Reclaimed water, Bodies of water, Groundwater, Groundwater basins, Watersheds(Basins), Great Lakes, Surface waters, Water quality control, Water pollution.

Six plants and distribution systems were studied: three treating Lake Ontario water (employing a full treatment regime of prechlorination, settling, coagulation, filtration, and free residual post-chlorination, before distribution); three using groundwater from wells (using either filtration and chlorination, or no treatment but with hypochlorite solution disinfection). No significant changes occurred in the chemical parameters studied (pH, turbidity, color, suspended solids, hardness, alkalinity, iron, manganese, ammonia, Kjeldahl nitrogen, nitrate, nitrite, chloride, phenol, sulfate, total organic carbon, and B.O.D.). Total bacteria count did not correlate with coliform occurrence, other indicators, or amount or type of chlorine residual. Temperature did not significantly correlate with total bacteria count, but distribution systems temperatures exceeded those at which bacterial growth would be expected. The presence/absence test was found to be more sensitive for coliform detection than the membrane filter test. (Zielinski-IPA)

FLAMELESS ATOMIC ABSORPTION FOR TRACING THE FATE OF HEAVY METALS IN SOILS AND GROUNDWATER,
Montana State Univ., Bozeman. Dept. of Civil Engineering.
R. L. Sanks.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189821, Price codes: A04 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University Report No 111, September, 1980. 55 p, 18 Fig, 7 Ref. OWRT-A-109-MONT(1), 14-34-0001-8028.

Descriptors: *Chemical analysis, *Heavy metals, Methodology, Analytical technique, Temperature, *Pollutant identification, Aqueous solution, Soil contamination, *Atomic absorption, Instrumentation, Detection.

A Varian AA-5 atomic absorption unit for measuring trace metals in soils and aqueous solutions was modified to improve the accuracy of the results and to reduce interference from matrix substances. A Woodriff Constant Temperature Furnace (WCTF) was added to simplify and speed analysis and to permit direct introduction of soil samples without tedious chemical pretreatment. The attempted modifications led to a complete redesign of an atomic absorption unit for performing the analysis of metals in soils. The new instrument is dependable and versatile. Liquid or soil samples may be analyzed with no chemical pretreatment. The standard error of analysis obtainable (1) for liquid samples is 5% at the 95% confidence level and (2) for soil samples is 7% at the 95% confidence level. These accuracies are not obtainable by current commercial models. Calibration curves for cadmium and zinc were established; techniques for sampling and performing direct analysis were developed.
W81-02491

ARE PUBLIC AND RECREATIONAL WATER SUPPLIES IN MONTANA SAFE FROM YERSINIA ENTEROCOLITICA GASTROENTERITIS,
Montana Univ., Missoula. Dept. of Microbiology.
M. J. Nakamura.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189839, Price codes: A02 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Bozeman Report No 108, Bozeman, 1980. 10 p, 1 Tab, 9 Ref. OWRT A-104 MONT(1), 14-34-0001-8028.

Descriptors: *Water quality, Water supply, *Pathogenic bacteria, Public health, *Potable water, Yersinia enterocolitica, Water-borne gastroenteritis, *Montana, Recreational water supply.

Yersinia enterocolitica has been implicated as the causative agent in numerous water-borne gastroenteritis. The detection system for this pathogenic bacterium is not widely used in the sampling of water supplies. Because some of the sources of previous human exposure have been drinking water supplies, this study was undertaken to sample and study public water supplies, e.g., drinking-fountains in public rest areas on interstate highways, public camp grounds, public swimming pools, surface waters, rivers, streams, and irrigation ditches. Of the 89 samples collected, only a few yield Yersinia enterocolitica. Montana is relatively free and safe from Yersinia enterocolitica contamination, at least, during the summer months. Studies of water samples should be expanded to include water collected during the winter months. Continued surveillance of water samples is necessary because the quality of water is subject to change from time to time as the conditions change.
W81-02492

A WATER QUALITY STUDY OF PLACID LAKE AND ITS DRAINAGE,
Montana Univ., Missoula. Dept. of Chemistry.
R. E. Juday, and E. J. Keller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189847, Price codes: A04 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Bozeman Report No 110, Bozeman, 1980. 62 p, 13 Fig, 25 Tab, 28 Ref. OWRT A-087-MONT(1), 14-31-0001-5026.

Descriptors: Water quality, *Nutrients, *Productivity, *Lakes, Lake morphometry, Dissolved oxygen, Phytoplankton, Zooplankton, Inorganic compounds, Mesotrophy, Oligotrophy, Microbiology, Western Montana, Clearwater lakes, Trophic classification, National Eutrophication Study(NES).

Water quality data acquired over a four-year period from 1974 through 1977 from Placid Lake and other waters of the Clearwater River drainage in western Montana were used to determine and describe the trophic states of six of the lakes in the drainage. In addition, data from seven other lakes were obtained in 1976 that were used to estimate their trophic states. Trophic states were established principally on the basis of summer and winter oxygen depletion rates, summer chlorophyll a levels, and transparency measurements. Three of the lakes were oligotrophic, four oligomesotrophic, and the remainder mesotrophic.

IDENTIFICATION AND DETECTION OF WATER-BORNE VIRUSES BY IMMUNOENZYMATIC METHODS,
Harvard School of Public Health, Boston, MA.
J. E. Herrmann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-224249, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/4-80-034, June, 1980. 44 p, 3 Fig, 15 Tab, 34 Ref. R-803360.

Descriptors: *Viruses, *Assay, Water pollution, *Coxsackie virus, *Enteroviruses, *Pollutant identification, Waste water analysis, Public health, Water analysis, Immunoassay.

A quantitative enzyme-linked immunosorbent assay (ELISA) was used for identification of viruses selected as representative water-borne viruses: poliovirus 1, echovirus 6, coxsackievirus A9, and coxsackie B viruses. Partially purified viral antigens or virus-specific antibodies were adsorbed to polystyrene spectrophotometer cuvettes, which permitted the assays to be reported and compared in terms of enzyme units specifically reacting. Inhibitors in diluents used to prevent non-specific adsorption of immunoreagents caused desorption of virus or antibody during an immunoassay; the amount of virus desorption varied with the type of preparation used, and antibody desorption was dependent on the concentration of antibody initially adsorbed. For specific identification of a given enterovirus type by this ELISA method, approximately 1,000,000 plaque-forming units of virus per assay tube were required. To alleviate the problem of antibody and virus desorption, antibodies and virus were immobilized by covalent linkage on nylon balls for use in solid-phase enzyme-linked immunoassays. A higher percentage of virus could be immobilized by this method than was possible by adsorption to polystyrene, and enzyme-linked immunoassay on nylon was sufficiently specific to differentiate the three poliovirus types. (Author's abstract)

A REVISED ESTIMATE FOR TRACE METAL FLUXES TO NARRAGANSETT BAY: A COMMENT,
Lamont-Doherty Geological Observatory, Palisades, NY.
P. H. Santschi.
Estuarine and Coastal Marine Science, Vol 11, No 1, p 115-118, July, 1980. 2 Tab, 19 Ref.

Descriptors: *Metals, *Sediments, *Narragansett Bay, *Trace elements, Pollutant identification, Lead, Copper, Zinc, Chromium, Water pollution, Rhode Island.

The author states that neglecting bioturbation of sediments in Narragansett Bay led to gross overestimation of anthropogenic trace metal fluxes as determined by Goldberg et al (1977). Examples (measured in micrograms per sq cm per year) are as follows: lead--old value 168, new value 15.7; zinc--330 old, 24.8 new; copper-260 old, 24.8 new; and chromium--219 old, 13.9 new. Natural fluxes were about 50% of Goldberg's values. The equation used to calculate the new values was: Flux = (concentration in top layer - concentration in bottom layer) times sediment accumulation rate. (Cassar-FRC)
W81-02549

A REVISED ESTIMATE FOR TRACE METAL FLUXES TO NARRAGANSETT BAY: A REPLY,
Scripps Institution of Oceanography, La Jolla, CA.

E. D. Goldberg, and M. Koide.
Estuarine and Coastal Marine Science, Vol 11, No 1, p 119, July, 1980. 3 Ref.

Descriptors: *Metals, *Sediments, *Narragansett Bay, *Trace elements, Rhode Island, Pollutant identification, Water pollution.

Goldberg replies to a comment on his 1977 paper on trace metal fluxes to Narragansett Bay by remarking that he still prefers his proposed chronology for the cores, that the changes which he determined in heavy metal concentrations with time are similar to those in other highly industrial areas, and that movement of sediment components could not take place through a solid layer of shells. PRESERVATION OF WATER SAMPLES.
Deutsche Gesellschaft Chemiker, Essen (Germany, F.R.). Fachgruppe Wasserchemie.
Water Research, Vol 15, No 2, p 233-241, February, 1981. 3 Fig, 5 Tab, 34 Ref.

Descriptors: *Preservation, *Water samples, *Mathematical studies, *Water analysis, Storage, Statistical analysis, Municipal wastes, Domestic wastes, Laboratory tests, Stability, Reliability, Data collections, Quality control.

The working party on the stabilization of samples of the German Chemists Association's hydrochemistry team has conducted tests on the preservation of samples of sedimented municipal effluent. The preservation techniques employed included deep-freezing, addition of alkali or acid, chloroform, and mercuric chloride. Round robin tests were conducted by several German laboratories on domestic effluent samples sedimented for 2 hours before treatment with the preservative to quantify the reliability of each preservation method. The six year studies also utilized the NALIMOV maverick test to determine whether the data material from one test day, which is assumed to show a normal arithmetic distribution, contains statistical mavericks. Use of this statistical tool ensures that results of statistical evaluations of the round robin tests take into account the practical facilities of each participating laboratory. From these investigations tables were generated of parameters that may or may not be preserved successfully by the methods studied. The recommended durations in days for each water parameter are also listed. (Geiger-FRC)

IDENTIFICATION OF ORGANIC SULFUR COMPOUNDS AND POLYCYCLIC HYDROCARBONS TRANSFERRED TO SHELLFISH FROM PETROLEUM SUSPENSION BY CAPILLARY MASS CHROMATOGRAPHY,
Okayama Univ. Medical School (Japan). Dept. of Public Health.
M. Ogata, and Y. Miyake.
Water Research, Vol 15, No 2, p 257-266, February, 1981. 5 Fig, 3 Tab, 11 Ref.

Descriptors: *Bioindicators, *Oil pollution, *Clams, Water pollution, Oil wastes, Oil spills, Adsorption, Analytical techniques, Gas chromatography, Pollutant identification, Organic compounds, Mass spectrometry, Shellfish, Sulfur compounds.

Short-necked clams (Tapea Angdala phillipinarum) were kept in laboratory tanks containing 250 milligrams/liter of crude oil suspension for 15 days to study the concentration factors of the water pollutants in the soft body tissues of these shellfish. The organic sulfur and polycyclic hydrocarbon compounds in clam extracts were also analyzed by capillary gas chromatography-mass spectrometry. Organic sulfur compounds of alkyl-benzothiophenes (C1-C6) and dibenzo-thiophene and alkyl-dibenzothiophenes (C1-C4) were present as markers of oil pollution of the clams. Gas chromatography with flame ionization detection (FID) was used to determine concentration factors of the organic sulfur compounds over the time duration of the experiment. Other aromatic compounds from the oil suspension such as naphthalene, alkyl-naphthalenes, phenanthrene, alkyl-phenanthrenes, pyrene and alkyl-pyrenes were also detected in the soft body tissues of the clams. Since trace amounts of organic sulfur compounds could be detected by FID gas chromatography, these substances are recommended for use as markers of oil pollution in fish. (Geiger-FRC)

DIRECT ANALYTICAL METHOD FOR ALIPHATIC COMPOUNDS IN WATER BY STEAM CARRIER GAS CHROMATOGRAPHY,
Yokohama National Univ. (Japan). Dept. of Safety and Environmental Engineering.
K. Urano, K. Ogura, and H. Wada.
Water Research, Vol 15, No 2, p 225-231, February, 1981. 13 Fig, 1 Tab, 11 Ref.

Descriptors: *Gas chromatography, *Organic compounds, *Pollutant identification, Analytical techniques, Water analysis, Separation techniques, Solubility, Temperature, Alcohols, Ethers, Ketones, Aldehydes, Organic wastes, Acids.

The influence of the carrier flowrate and column temperature on the separation characteristics of steam carrier gas chromatography (SCGC) was examined using Chromosorb P AW modified with phosphoric acid. The SCGC technique is useful in detecting polar organic compounds at minute levels in water samples. Optimum flowrates for analyzing water samples containing several groups of aliphatic compounds were approximately 60 ml/minute of carrier steam while the best temperature range for the determination was from 150 to 180 degrees. Relationships were obtained between the retention time and the boiling point of soluble and slightly soluble groups. When the retention time of an aliphatic compound is known, it is possible to predict its boiling point and solubility. Conversely, the retention time of a compound may be estimated if its boiling point and solubility are known. The relative peak area was found to increase proportionally with increasing carbon number of the compound. Many aliphatic and some polar compounds present in water samples at levels greater than 40 micrograms/liter may be analyzed directly by SCGC without pretreatment measures. (Geiger-FRC)

COMPARATIVE STUDY OF MEMBRANE FILTRATION METHODS FOR THE ISOLATION OF GROUP D STREPTOCOCCI FROM WATER,
Rijksinstituut voor de Volksgezondheid, Bilthoven (Netherlands).
A. H. Havelaar, and H. W. B. Engel.
Water Research, Vol 15, No 2, p 191-197, February, 1981. 2 Fig, 5 Tab, 12 Ref.

Descriptors: *Pollutant identification, *Coliforms, *Isolation, Filtration, Separation techniques, Water pollution, Bioindicators, E. coli, Streptococcus, Pathogenic bacteria, Temperature, Water quality, Sewage bacteria, Water quality standards.

Traditionally, the testing of water samples for the presence of Escherichia coli was considered an adequate screening method for detecting fecal pollution. However, since this organism exhibits a low survival rate outside of the gastrointestinal tract, tests for other, more persistent indicator organisms such as fecal streptococci are advocated. A comparative study of isolation methods for the group D streptococci was organized by the Netherlands National Institute of Public Health. Nine laboratories collaborated in evaluating the efficiency of two membrane filtration media (KF-streptococcus agar and bile esculin azide agar) for isolation of bacteria from sewage, secondary effluent, chlorinated effluent, surface water, stored water and almost fully treated drinking water. Bacterial isolations were carried out at 37 and 44C. Organisms subcultured from the media were classified as group D streptococci if they were catalase negative and able to grow at 45C. Significantly fewer group D streptococci colonies were formed on bile esculin azide agar than on KF. Neither medium exhibited improved selectivity by incubation at 44C instead of 37C. At 44C, recovery was significantly reduced, especially if the bacteria were damaged by chlorine. For membrane filtration, KF-streptococcus agar at 37C was recommended. (Geiger-FRC)

POLAROGRAPHIC MEASUREMENT OF SURFACE-ACTIVE MATERIAL IN NATURAL WATERS,
University of East Anglia, Norwich (England). School of Environmental Sciences.
K. A. Hunter, and P. S. Liss.
Water Research, Vol 15, No 2, p 203-215, February, 1981. 16 Fig, 3 Tab, 29 Ref.

Descriptors: *Surfactants, *Polarographic analysis, Analytical techniques, *Pollutant identification, Estuaries, Salinity, Organic compounds, Surface waters, Sea water, Suspended solids, Water pollution.

An electrochemical procedure for the determination of the effective concentration of natural and man-made surface-active agents in natural waters is described. The method is based on the surfactant suppression of the polarographic streaming maximum which occurs on the reduction wave of Hg(II) in aqueous solution. The effects of depolarizer concentration, Hg reservoir height, drop time, and temperature on the process were studied. When a calibration graph prepared with Triton X-100 was used to determine surfactant activities in seawater samples, the overall precision showed a variation coefficient of 3%, which included blank corrections. The maximum peak current decreased exponentially with salinity, allowing correction of the current values for estuarine samples to a constant salinity of 33.43%. When seawater and river water are mixed, the determined surfactant activity is a conservative property which is unaffected by flocculation for a few days. The technique has been applied to estuarine water, coastal seawater and surface microlayer samples. Surface layer samples were enriched in surfactant matter compared to subsurface waters. In many instances, the present method may be used as a substitute for dissolved organic carbon (DOC) determinations. In general, good correlations were found between results from the polarographic technique and DOC levels from many different estuarine samples. (Geiger-FRC)

THE LINEAR PLOT: A NEW WAY OF INTERPRETING TITRATION DATA, USED IN DETERMINATION OF WEAK ACIDS IN LAKE WATER,
Swedish Water and Air Pollution Research Lab., Goeteborg.
Y. H. Lee.
Water, Air, and Soil Pollution, Vol 14, p 287-298, 1980. 4 Fig, 6 Tab, 12 Ref.

Descriptors: *Volumetric analysis, *Lakes, *Fulvic acids, Acids, *Pollutant identification, Analytical techniques, Hydrogen ion concentration, Organic acids, Chemical properties.

The concentration and pK value of monobasic weak acids such as fulvic acid may be simultaneously determined in lake water using a method based on a linear plot of Brosset's function for the slope of Gran's plot. This titration method is applicable to monobasic weak acids with pK 4 to 9 even in the presence of a strong acid. All colored lake water samples studied contained a weak acid with pK 4.4-4.7. Two samples showed the presence of an unknown second acid with pK of 3.4-3.7. (Cassar-FRC)

CONCENTRATIONS OF HEAVY METALS IN FORTY SEWAGE SLUDGES IN ENGLAND,
Imperial Coll. of Science and Technology, London (England). Public Health Engineering Lab.
R. M. Sterritt, and J. N. Lester.
Water, Air, and Soil Pollution, Vol 14, p 125-131, 1981. 3 Tab, 19 Ref.

Descriptors: *Sewage sludge, *Heavy metals, *Sludge disposal, Metals, Soil amendments, *Pollutant identification, Ultimate disposal, Agriculture, Fertilizers, Land, Cadmium, Cobalt, Chromium, Copper, Manganese, Molybdenum, Nickel, Lead, Tin, Zinc.

Samples of 40 sewage sludges in England were analyzed by flameless atomic absorption spectroscopy to determine 10 heavy metals. Compositions of the sludges varied widely, with concentration ranges over a 100-fold spread. Over 75% of the sludges contained enough zinc, copper and nickel to limit land application to no more than 2 tons per hectare per year. The metal concentrations with their means and ranges, expressed in mg per kg dry weight, were as follows: Cd, 24.8, 1.54-110; Co, 105, 11.3-2490; Cr, 707, 57.2-5190; Cu, 721, 170-2080; Mn, 667, 131-6120; Mo, 16.2, 0.102-214; Ni, 290, 16.2-2020; Pb, 1550, 27.5-45,400; Sn, 57.5, 2.65-329; and Zn, 1930, 93.5-9210. (Cassar-FRC)

MONITORING DEVICE SIMPLIFIES SAMPLE COLLECTION.
Water Well Journal, Vol 34, No 11, p 48-50, November, 1980. 3 Fig.

Descriptors: *Sampling, *Water sampling, *Instrumentation, *Barcad sampler, Water analysis, Pollutant identification, Observation wells, Wells.

The BarCad groundwater sampling instrument is designed to reduce costs and improve the performance of subsurface contaminant studies. The sampler, a porous, hollow cylinder, is permanently contained in a 3 inch borehole. Successive samplers are installed at desired depths and separated by bentonite clay sealers. Water is conducted to the surface through a small diameter riser tube concentric within a larger gas drive tube. Compressed inert gas such as nitrogen activates the sampler. Samples are obtained as slugs of water. The only tools necessary are an adjustable wrench, tank of compressed gas, and sample bottles. (Cassar-FRC)

MICROBIOLOGY OF WATER--QUALITY ASSURANCE,
Environmental Monitoring and Support Lab., Cincinnati, OH.
R. H. Bordner.
Journal of the Water Pollution Control Federation (Literature Review Issue), Vol 52, No 6, p 1800-1804, June, 1980. 37 Ref.

Descriptors: *Microbiology, *Standards, *Water quality control, *Reviews, Bibliographies, Quality control, Laboratories, Publications, Safety, Bacteria, Microorganisms, Pollutant identification, Analytical techniques.

Recent developments in quality assurance of water include several new publications--a comprehensive source book published by the American Public Health Association, a handbook released by the EPA, a manual from UNESCO, and guides from Canada and the Commission of the European Communities. EPA's laboratory certification program is highlighted. Specific studies on various standards and methods for improving quality assurance include sterilization, multitest systems, staining methods, and statistical problems. Safety precautions and safe working practices in biological laboratories were the subject of several papers. (Cassar-FRC)

MICROBIOLOGY: DETECTION OF BACTERIAL PATHOGENS AND THEIR OCCURRENCE,
Environmental Protection Agency, Cincinnati, OH.
D. J. Reasoner.
Journal of the Water Pollution Control Federation (Literature Review Issue), Vol 52, No 6, p 1812-1833, June, 1980. 4 Tab, 122 Ref.

Descriptors: *Pathogenic bacteria, *Microbiology, *Reviews, Public health, Bibliographies, Potable water, Water pollution sources, Animal pathology, Pollutant identification, Analytical techniques, Salmonella, Bacteria, Yeasts, Coliforms, Water analysis, Enteric bacteria, Animal diseases.

Recent papers on determination and occurrence of bacterial pathogens are reviewed. Animals are the source of many bacterial pathogens affecting humans. Four tables (E. Coli and Salmonella in warm-blooded animals, Salmonella and Enterobactericeae in cold-blooded animals, Leptospira in animals, and miscellaneous bacterial and opportunistic pathogens in animals) list the animal source, organism, a brief summary, and reference number for about 55 papers. Other sources of bacterial contamination in potable water are distribution system breaks and repairs, cross-connections, back-siphonage, and deficient treatment procedures. New and improved methods of isolating and detecting pathogens are described. (Cassar-FRC)

METALS IN NEREID POLYCHAETES: THE CONTRIBUTION OF METALS IN THE JAWS TO THE TOTAL BODY BURDEN,
Marine Biological Association of the United Kingdom, Plymouth (England).
G. W. Bryan, and P. E. Gibbs.
Journal of the Marine Biological Assoication of the United Kingdom, Vol 60, No 3, p 641-654, August, 1980. 3 Fig, 7 Tab, 17 Ref.

Descriptors: *Bioindicators, *Metals, *Nereids, *Zinc, *Pollutant identification, Absorption, Trace elements, Heavy metals, Polychaetes, Sediments, Worms, Invertebrates, Aquatic animals, Benthic fauna, Silver, Copper, Cadmium, Iron, Lead.

Use of Nereids as bioindicators for metal contamination in sediments may not be accurate for zinc, which may have a structural role in the jaw rather than being the result of a detoxification process. Zinc was not evenly distributed within the Nereis virens jaw. The highest level of zinc was found in the distal tip (45,740 micrograms per gram) and the lowest level, 1,790 micrograms per gram, in the basal part. Zinc concentration in the total jaw was 10,130 to 18,360 micrograms per gram dry weight. In small worms, the jaw zinc accounted for over 40% of total body zinc; in larger worms, 30% or less. Analysis of Nereis diversicolor from an uncontaminated site and from a sediment with 16 times the zinc level of the first sample showed no difference in jaw zinc and only a 3-fold increase in body zinc, suggesting that zinc is regulated by the nereid. Other metals detected in Nereis virens were (micrograms per gram dry weight): Na, 1150-2690; Mg, 616-1080; Ca, 531-1130; Fe, 444-1180; Mn, 510-952; K, 270-960; Cu, 4-80; Pb, 8.7; Cd, 0.1; and Ag, less than 0.1. Concentrations of Cu and Ag in whole worms and jaws did reflect sediment levels, but Fe was variable. Jaw Mn contributed over 50% to the total in small worms, decreasing with increasing body size, to 20%. The jaws contained less than 1% of the total body burden of the following metals: Ag, Cd, Cu, Fe, and Pb. (Cassar-FRC)

5B. Sources Of Pollution

EFFECTS OF STRIP MINING THE ABANDONED DEEP ANNA S MINE ON THE HYDROLOGY OF BABB CREEK, TIOGA COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
L. A. Reed.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121337, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-53, August, 1980. 41 p, 16 Fig, 13 Tab, 8 Ref.

Descriptors: *Strip mines, *Acid mine water, *Mine drainage, *Water pollution effects, *Pennsylvania, Acid streams, Water quality, Neutralization, Alkalinity, Water analysis, Sediment discharge, Tioga County(PA), Babb Creek(PA), Daylighting.

Daylighting (strip mining of coal seams previously deep mined) operations are being conducted on the Anna S Mine, that underlies about 850 acres that are drained by three major discharges. The Hunter Drift drains an underground area of about 400 acres, the Anna S 1 main entry, an area of 330 acres, and Mitchel 2 discharge an area of about 120 acres. As of August 1, 1979, about 55 acres (15%) had been daylighted in the Hunter Drift basin, about 15 acres (5%) in the Anna S main entry basin and about 30 acres (25%) in the Mitchel basin. The acidity of the Mitchel 2 discharge changed the most, from 176 milligrams per liter (as CaCO3) in 1975-76 to 1,190 in 1978-79, an increase of 580%. The acidity of the Hunter Drift discharge increased from 348 milligrams per liter during 1975-76 to 710 milligrams per liter during 1978-79, an increase of 100%. The acidity of Anna S 1 increased about 45%. (USGS)

MICROORGANISMS IN STORMWATER--A SUMMARY OF RECENT INVESTIGATIONS,
Geological Survey, Syosset, NY. Water Resources Div.
G. E. Mallard.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $2.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1198, 1980. 18 p, 3 Fig, 2 Tab, 27 Ref.

Descriptors: *Microorganisms, *Storm water, *Storm runoff, *Coliforms, *Bacteria, Enteric bacteria, Pathogenic bacteria, Urban runoff, Surface waters, Analytical techniques, Water quality, Water pollution sources, Pollutant identification, Coliforms, Fecal-indicator bacteria.

All storm runoff contains a variety of bacteria, including total coliform, fecal coliform, and fecal streptococci, which are derived from the land over which the water flows. Most total coliform are native soil organisms, whereas the fecal coliform and fecal streptococci originate from the feces of wild and domestic animals. Urban runoff has been reported to contain pathogenic organisms, but this probably presents little direct threat to human health because the runoff is not ingested. Runoff water can, however, have other negative effects such as contamination of surface water, which may result in beach closures, or contamination of shellfish. This type of contamination is generally of short duration because indicator bacteria and pathogens die out rapidly in the aquatic environment. Similarly, bacteria and viruses deposited on soil by stormwater are inactivated by drying, competition from soil microflora, and a variety of other processes. Every storm producing runoff is unique in the number and type of microorganisms because these vary from site to site, from storm to storm, and during the course of the storm. Stormwater to be examined for microorganisms must be collected in sterile containers and processed immediately. (USGS)
W81-02478

QUALITY OF URBAN RUNOFF, TECOLOTE CREEK DRAINAGE AREA, SAN DIEGO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. G. Setmire, and W. L. Bradford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-159451, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-70, September, 1980. 33 p, 12 Fig, 10 Tab, 13 Ref.

Descriptors: *Water quality, *Urban runoff, *Storms, *Watersheds(Basins), *California, Water management(Applied), Rainfall-runoff relationships, Discharge(Water), Pollutants, Pesticide residues, Water pollution sources, Chemical oxygen demand, Lead, Nitrogen, Bacteria, San Diego County, Nonpoint pollution sources.

The quality of storm runoff from a 9.2-square-mile urbanized watershed, Tecolote Creek, San Diego County, Calif., was studied during nine storms from September 1976 through May 1977. Specific conductance reached 2,100 micromhos and total residue concentrations reached 2,770 milligrams per liter. The chemical oxygen demand concentration in 95% of the samples exceeded 50 milligrams per liter, a concentration that may be sufficient to cause severe oxygen depletion in areas of the receiving water, Mission Bay. Lead concentrations in all samples exceeded concentrations thought to affect some aquatic organisms. Median total nitrogen and total orthophosphorus concentrations were far in excess of concentrations known to cause nuisance growth of algae in lakes. Fecal coliform bacteria concentrations greatly exceeded recommended levels for primary contact recreation water. Concentrations of pesticides--heptachlor, malathion, chlordane, DDT, diazinon, and dieldrin--frequently exceeded the recommended maximums for marine or freshwater aquatic systems. Total loads of selected constituents are calculated and may be used to estimate the impact of runoff on the receiving water. (USGS)

GROUNDWATER OF COAL DEPOSITS, BAY COUNTY, MICHIGAN,
Geological Survey, Lansing, MI. Water Resources Div.
J. R. Stark, and M. G. McDonald.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-591, July, 1980. 36 p, 22 Fig, 1 Tab, 13 Ref, Append.

Descriptors: *Coal mines, *Groundwater, *Mine drainage, *Aquifer characteristics, *Michigan, Probability, Model studies, Hydrogeology, Water quality, Chemical analysis, Model studies, Hydraulic conductivity, Storage coefficient, Observation wells, Water levels, Pumping, Drawdown, *Bay County(MI).

A coal deposit in Bay County, Mich., typical of Pennsylvanian-coal deposits in the State, was studied to determine the degree to which hydrologic factors might affect future coal mining. The coal deposit, which averages about 0.5 meters in thickness, lies 50 meters below land surface. It is part of a multi-layered aquifer system that contains sandstone, shale, sand and gravel, and clay units in addition to beds of coal. Hydrologic characteristics (hydraulic conductivity and storage coefficient) of each unit were evaluated by analyses of aquifer tests and a finite-difference groundwater flow model. A model simulating groundwater flow to a hypothetical mine was developed. Results of the study indicate that seepage will probably not be great enough to preclude mining coal. Also, pumping water to keep the mine dry will have little effect on heads in aquifers outside the mine during the first decade of mining. Although coal was mined in Michigan during 1860-1950, significant reserves remain. These deposits, part of the Saginaw Formation of Pennsylvanian age, are near the industrialized parts of the State. The quantity of pumped water needed to keep mines dry and the effect of pumping on aquifers surrounding the mines is a major factor in determining the feasibility of opening new mines. (USGS)

WORK PLAN FOR THE SCHUYLKILL RIVER BASIN, PENNSYLVANIA: ASSESSMENT OF RIVER QUALITY AS RELATED TO THE DISTRIBUTION AND TRANSPORT OF TRACE METALS AND ORGANIC SUBSTANCES,
Geological Survey, Harrisburg, PA. Water Resources Div.
G. L. Pederson, T. H. Yorke, and J. K. Stamer.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price : $3.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-566, October, 1980. 27 p, 1 Fig, 7 Tab, 7 Ref.

Descriptors: *Water quality, *River basins, *Pennsylvania, *Organic compounds, *Trace elements, Metals, Sediment transport, Sediment distribution, Flow characteristics, Water supply, Water utilization, Water analysis, Planning, Water management(Applied), *Schuylkill River(PA).

The U.S. Geological Survey is making a river-quality assessment of the Schuylkill River basin in Pennsylvania from October 1978 to March 1981. The assessment is part of a continuing program designed to demonstrate the effectiveness of river-quality studies for basin planning and water-resource management. Study objectives include determining (1) presence of selected trace metals and organic substances in the water and sediments of the Schuylkill River between Berne and Philadelphia; (2) source, distribution, and transport of selected trace metals and organic substances in the river from Berne to Philadelphia; (3) frequency of occurrence of selected trace metals and organic substances in the river at Pottstown and Manayunk; (4) effects of low-level dams on the distribution and transport of selected trace metals and organic substances in the Schuylkill River between Pottstown and Philadelphia. FATE AND TRANSPORT OF DIELDRIN IN CORALVILLE RESERVOIR: RESIDUES IN FISH AND WATER FOLLOWING A PESTICIDE BAN,
Iowa Univ., Iowa City
J. L. Schnoor.
Science, Vol 211, No 4484, p 840-842, February, 1981.

Descriptors: *Dieldrin, *Pesticide residues, *Model studies, *Coralville Reservoir, Iowa River, Path of pollutants, Aldrin, Insecticides, Mathematical models, Water pollution sources, Fish, Sediment, Water analysis, Decision making, Reservoirs, Chlorinated hydrocarbon pesticides, Iowa.

A model of pesticide fate and bioconcentration was developed and applied to the Coralville Reservoir, Iowa. This model was intended to aid in the decision to lift a commercial fishing ban, imposed in 1976 because dieldrin levels in bottom-feeding fish were greater than the Food and Drug Administration guidelines of 0.3 mg per kg wet basis. Use of aldrin and its degradation product, dieldrin, peaked in Iowa in the mid 1960's. The EPA cancelled registration of these pesticides in 1975. Dieldrin residues in water, fish, and sediments have decreased by 15% per year since 1969-1970. The model determined that 40% of the dieldrin entering the reservoir is adsorbed by sediment, 50% is released through the dam gates, and 10% is taken up by fish. Dieldrin degrades at the rate of 0.1% per day in sediment. Projections indicate that residues in fish should average less than 100 micrograms per kg by 1986. (Cassar-FRC)

TECHNIQUE FOR DETERMINING THE VOLATILIZATION COEFFICIENTS OF PRIORITY POLLUTANTS IN STREAMS,
Geological Survey, NSTL Station, MO. Gulf Coast Hydroscience Center.
R. E. Rathbun, and D. Y. Tai.
Water Research, Vol 15, No 2, p 243-250, February, 1981. 3 Fig, 2 Tab, 21 Ref.

Descriptors: *Volatility, *Path of pollutants, *Tracking techniques, Tracers, Radioactivity techniques, Toxins, Aromatic compounds, Organic wastes, Natural streams, Laboratory tests, Gas chromatography.

Of the 129 EPA priority pollutants, 31 are purgeable organics. Knowledge of the volatility of these compounds in natural waters will aid in studying their fate as pollutants of rivers and streams. Laboratory tests were conducted to determine the volatilization coefficients of benzene, chloroform, methylene chloride and toluene concurrently with the measurement of the oxygen absorption coefficient over a range of mixing conditions. A tracer technique was used which was based on the mathematical relationship between the liquid-film coefficients for a tracer material (rhodamine WT dye) and for the organic solute (ethylene or propane) volatilizing from the same water. When the constancy of the ratios between the organic solute and oxygen coefficients is applied to the modified tracer technique for the measurement of stream reaeration coefficients, the volatilization coefficients of these solutes may be calculated for any stream or river without direct introduction of the compounds into the natural waters. The calculated volatilization coefficients for these solutes in a number of streams and rivers of the United States are presented. (Geiger-FRC)

THE FATE OF SEWAGE PHOSPHORUS INPUT TO A SUBARCTIC LAKE CHAIN,
McMaster Univ., Hamilton (Ontario). Dept. of Geography.
J. J. Drake, and I. J. Freund.
Water, Air, and Soil Pollution, Vol 14, p 331-337, 1980. 4 Fig, 7 Ref.

Descriptors: *Lakes, *Phosphorus compounds, *Sewage disposal, *Nutrients, Phosphates, Eutrophication, Subarctic, Pearce Lake, Canada, Dissolved oxygen, Iron compounds, Sedimentation, Water pollution effects, *Path of pollutants, *Quebec.

Pearce Lake, Quebec, receives the sewage from the iron mining town of Schefferville, population 4500. This paper describes the fate of phosphorus in this subarctic lake and 2 other connected lakes during the year. In winter the lake is ice covered. Sewage accounts for 35% of the total inflow. Water residence time is 60 days, phosphorus concentration is as high as 1.0 mg per liter. and dissolved oxygen is very low (less than 1 mg per liter in bottom waters. During the spring melt, residence time is 2 days and total phosphorus concentration drops to less than 0.1 mg per liter, remaining at this level during summer and fall. Iron-rich groundwater promotes sedimentation of phosphorus in Pearce Lake, mostly during the spring melt. About 80% of the phosphorus remains sedimented in Pearce Lake. The top 25 cm of sediment con

tains significantly more phosphorus than deeper sediments. Although water from Pearce Lake flows into LaCosa Lake and June Lake, only 12% of the phosphorus load leaves the 3-lake system. Although the subarctic is generally considered a sensitive environment, in this case Fe-rich anoxic groundwater and extremely rapid spring flushing allows sewage disposal with surprisingly little environmental impact. HAZARDOUS WASTE MANAGEMENT: STATE BY STATE.
Water Well Journal, Vol 34, No 11, p 55-57, November, 1980. 1 Tab, N. Thompson, compiler.

Descriptors: *Legislation, *Waste disposal, *Water pollution sources, Water law, Well regulations, Water wells, Test wells, State governments, *Hazardous materials.

A table lists hazardous waste legislation and the office in charge of hazardous waste management for each state. At present 36 states and the District of Columbia have laws regulating hazardous waste; 14 do not. States without such legislation are Alaska, Arizona, Colorado, Florida, Hawaii, Idaho, Indiana, Nebraska, Pennsylvania, South Dakota, Tennessee, Virginia, West Virginia, and Wyoming. This compilation is directed toward water well drillers working with groundwater monitoring programs for hazardous waste disposal facilities. (Cassar-FRC)

THE IMPORTANCE OF GROUNDWATER MONITORING,
D. Nielsen.
Water Well Journal, Vol 34, No 11, p 38-39, November, 1980.

Descriptors: *Groundwater, *Water quality, *Monitoring, Resource Conservation and Recovery Act, Water pollution sources, Waste dumps, Pollutant identification, Legislation, Regulation, Analytical techniques, Test wells.

Although groundwater is the source of drinking water for 110 million people in the U.S., it remains relatively unprotected from contamination from landfills, industrial wastes, mining and oil well drilling operations, waste water effluents, septic tanks, and farm wastes. The Resource Conservation and Recovery Act (RCRA) requires state agencies to inventory groundwater pollution sources and design and implement programs for monitoring. At hazardous waste disposal sites, 4 monitoring wells are required. A groundwater monitoring program must inventory background water quality, determine and analyze causes of water quality variations, and predict future water quality changes. Problems in implementing a successful monitoring program are interpretation of legal requirements and data, selection of sample frequency and parameters, and construction of equipment. Help in solving these problems is not easily available because there is not yet much agreement on the best methods to use. In addition, groundwater monitoring technology is not as advanced as surface water monitoring technology. Solutions to these problems must be found if groundwater monitoring is to be smoothly implemented. (Cassar-FRC)

SYNTHETIC ORGANIC COMPOUNDS IN GROUNDWATER,
T. Gass.
Water Well Journal, Vol 34, No 12, p 28-29, December, 1980. 1 Tab.

Descriptors: *Organic compounds, *Chemical wastes, *Potable water, *Groundwater, Industrial wastes, Waste disposal, Water quality, Landfills, Aquifers, Water pollution sources, Water wells, Wells.

A federal monitoring program showed that 60% of 39 groundwater supplies tested contained 1 or more synthetic organic chemicals. Frequencies of chemicals found in raw groundwater were as follows: trichloroethylene, 33%; carbon tetrachloride, 7%; tetrachloroethylene, 18%; methylene chloride, 2%; and vinyl chloride, 16%. All of these chemicals are used industrially, and many are suspected of causing cancer, birth defects, and other health effects in small concentrations. Examples are given of 2 cases where community water wells were contaminated with waste oil or chemical wastes. (Cassar-FRC)

TO WHAT EXTENT IS GROUND WATER CONTAMINATED,
T. E. Gass.
Water Well Journal, Vol 34, No 11, p 26-27, November, 1980. 2 Tab.

Descriptors: *Groundwater, *Aquifers, *Water pollution sources, *Water quality, Waste dumps, Landfills, Mining, Soil disposal fields, Septic tanks, Municipal wastes.

A model has been developed to estimate the extent of groundwater contamination based on number of sites, permeability of soil, location of nearby aquifers, characteristics of the waste, and disposal site design and operating procedures. Of 25,000 active industrial waste impoundments, about 8,400 pose a hazard to usable aquifers. If each site contaminates 60 acres, the total area contaminated would be 790 sq miles. About 14,000 to 90,000 landfills are located in areas with rainfall, soil, and aquifer conditions conducive to pollution. Assuming a 60 acre per site contamination area it is calculated that 1,300 to 8,400 sq miles may be affected. Subsurface disposal systems may affect about 50,000 sq miles, and petroleum and mining activities another 5,000 sq miles. These figures indicate that 1.2 to 1.5% of the total usable aquifer area in the United States may presently be polluted. (Cassar-FRC)

MICROBIOLOGY OF GROUNDWATER,
Environmental Protection Agency, Dallas, TX.
M. J. Allen.
Journal of the Water Pollution Control Federation (Literature Review Issue), Vol 52, No 6, p 1804-1807, June, 1980. 30 Ref.

Descriptors: *Microbiology, *Groundwater, *Reviews, Path of pollutants, Bibliographies, Bacteria, Microorganisms, Water pollution sources, Coliforms.

A review of the 1979 literature on groundwater microbiology includes a variety of studies. Statistics are given on waterborne disease associated with contaminated groundwater. The effect of rainfall patterns on microbiological quality of groundwater supplies is described. A case of Salmonella pollution in the absence of coliform pollution is attributed to lizards in the wells. Petroleum in groundwater is slow to degrade because dissolved oxygen, organic nitrogen, and phosphorus are limited. A study on viruses indicated that a soil pH of 5 or lower resulted in good absorption of viruses. With respect to bioindicators, antibiotic-resistant E. coli proved more suitable as a tracer in monitoring soil water movement than fluorescent dyes. Several studies were done on movement of microorganisms through the soil after application of domestic or farm wastes. Bacteriological aspects of oil and gas drilling were discussed. Methanotrophic bacteria were found associated with oil and gas well water. Bacteriological consequences of using carbohydrate polymers in drilling fluids were discussed. (Cassar-FRC)

SOURCES OF SOLUBLE ORGANIC NITROGEN IN ACTIVATED SLUDGE EFFLUENTS,
Stanford Univ., CA. Dept. of Environmental Engineering.
G. F. Parkin, and P. L. McCarty.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 89-98, January, 1981. 8 Fig, 4 Tab, 15 Ref.

Descriptors: *Nitrogen compounds, *Activated sludge, *Organic compounds, *Effluents, Waste water treatment, Biodegradation, Chemical oxygen demand, Suspended solids, Aeration, Path of pollutants, Water pollution sources.

Sources of soluble organic nitrogen (SON) in activated sludge effluents were determined. Minimum SON concentrations resulted from operation of conventional activated sludge plants with solids retention times of 6-10 days. 60-70% SON and 70-80% soluble COD were removed. About 20-40% of the SON in the effluent was produced biologically during the process, and the remainder from residual organics in the influent. The biologically-produced SON came from 3 sources: equilibration with the activated sludge organisms (independent of organism concentration and temperature and dependent on culture characteristics--20-50% of the total), organism decay (a function of mixed liquor suspended solids concentration and of the solids retention time--20-50% of the total), and substrate oxidation (small compared with the others). (Cassar-FRC)

PRODUCTION OF SOLUBLE ORGANIC NITROGEN DURING ACTIVATED SLUDGE TREATMENT,
Stanford Univ., CA. Dept. of Environmental Engineering.
G. F. Parkin, and P. L. McCarty.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 99-112, January, 1981. 16 Fig, 6 Tab, 29 Ref.

Descriptors: *Nitrogen compounds, *Activated sludge, *Organic compounds, *Effluents, Waste water treatment, Biodegradation, Chemical oxygen demand, Suspended solids, Aeration, Path of pollutants, Water pollution sources.

The concentration of soluble organic nitrogen (SON) in the activated sludge process was variable and related to uncontrollable cultural factors. During activated sludge startup, effluent SON increased by several mg per liter as a result of biological production of SON. Results of this study confirmed conclusions presented in a previous report. (Cassar-FRC)

THE POTENTIAL FOR GROUNDWATER CONTAMINATION FROM SEPTIC EFFLUENTS,
Mississippi State Univ., Mississippi State. Dept. of Agronomy.
C. Hagedorn, E. L. McCoy, and T. M. Rahe.
Journal of Environmental Quality, Vol 10, No 1, p 1-8, January/March, 1981. 1 Tab, 60 Ref.

Descriptors: *Path of pollutants, *Septic tanks, *Reviews, Domestic wastes, *Groundwater pollution, Coliform bacteria, Pathogens, Water pollution sources, Viruses, Soil disposal fields, Recharge, Groundwater, Environmental sanitation, Waste water disposal, Percolation.

There is increasing evidence that the pollution of groundwater in many cases may be traced to faulty septic tank systems that use soil percolation and microbial activity to remove pathogens and wastes from domestic effluents. A review is presented on the contamination of recharge waters in both rural and urban areas of the United States due to incompletely treated septic wastes. The conditions that prevail during septic system malfunctions and the means by which fecal pathogens come into contact with various water resources are examined. The functions of drainfield systems and results from microbiological studies on the conditions required for the effective removal of enteric organisms from domestic effluents are discussed. Bacterial transport through soils and the removal of viruses from waste effluents are considered. The need for improved septic tank systems is stressed, with suggestions for determining the suitability of septic tank systems in relation to regional soil-water conditions. (Geiger-FRC)

THE OIL SPILL AGE--FATE AND EFFECTS OF OIL IN THE MARINE ENVIRONMENT,
Centre National pour l'Exploitation des Oceans, Paris (France).
P. Nounou.
Ambio, Vol 9, No 6, p 297-302, 1980. 31 Ref.

Descriptors: *Oil spills, *Water pollution effects, *Path of pollutants, Environmental effects, Ecology, Toxicity, Oil pollution, Marine animals, Marine plants, Aquatic life, Biodegradation, Degradation, Ships, Sediments, Persistence, Water pollution sources.

This paper presents a summary of the fate and effects of oil pollution in the marine environment and prospects for the future. Although large spills from wrecked ships or blown wells are more spectacular, 90% of oil in the ocean comes from rivers, coastal refineries, deballasting by tankers, offshore exploration, and natural seepage. Within a few days after a discharge, oil spreads on the surface, the volatile components evaporate, and the oil disperses according to properties of the oil and the energy in the environment. Emulsification and tar lump formation can occur. Oil may then degrade chemically or biologically or persist in sediment. Literature on effects of petroleum on marine organisms is not very consistent because researchers use different techniques and different oils. Lethal concentrations vary with species and age of the organism, eggs being very sensitive. Sublethal effects are many. Direct coating and ingestion of oil affect immobile species, such as barnacles and algae, as well as sea birds. Edible fish and shellfish can be contaminated. Bioaccumulation of carcinogens in food chains is widespread, as are disturbances in ecosystems. The greatest damage occurs near the shore, but deep-sea contamination of breeding grounds or migration routes can severely damage some species. (Cassar-FRC)

5C. Effects Of Pollution

RESPONSES OF COPEPOD INDIVIDUALS AND POPULATIONS TO INCREASED TEMPERATURE VARIABILITY,
Maryland Univ., Baltimore County, Baltimore. Dept. of Biological Sciences.
B. P. Bradley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185266, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, 1980. University of Maryland, College Park, Water Resources Research Center Technical Report No 62. 25 p, 1 Fig, 16 Tab, 6 Ref. OWRT-A-053-MD(1), 14-34-0001-0122.

Descriptors: *Copepods, On-site investigations, *Thermal pollution, *Powerplants, Water pollution sources, *Water pollution effects, Aquatic animals, *Aquatic life, Crustaceans, On-site data collections, Water pollution, Heated water, Electric power plants, Industrial plants, Pollutant identification, Pollutants, Temperature, Warm temperature, Water quality, Mortality, Stress analysis.

Emphasis in this study was placed on field studies of populations of two species of copepods, Eurytemora affinis (EA) and Acartia tonsa (AT), in the vicinity of two power plants. These species are seasonally dominant; EA in winter and spring, AT in summer and fall. The study sought to identify the effects of waste heat on local population densities and survival. Results include temperature variation measurements around the power plants, observed temperature tolerances and species population densities, limited laboratory studies on reproduction following shock, and preliminary estimates of potentials for adaptation. Variability in density and temperature tolerances of EA and AT were associated with temperature variability caused by power-generating plant waste heat. At least part of the diversity between stations in EA tolerance of temperature was genetic. Greatest stress seemed to occur at a station having low circulation of heated water, suggesting that chronic long-term heat stress may be more harmful than acute short-term heat stress. Data on reproduction suggested entrainment followed by discharge into rapidly cooled waters would have less impact than chronic exposure at a lower temperature. (Zielinski-IPA)

LABORATORY SIMULATION OF ACID RAIN EFFECTS ON FRESHWATER MICROCRUSTACEANS,
Maryland Univ., College Park. Dept. of Zoology.
J. D. Allan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185225, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, 1980. University of Maryland Water Resources Research Center Technical Report No 60. 5 p, 1 Fig, 1 Tab, 4 Ref. OWRT-A-054-MD(1), 14-34-0001-9022.

Descriptors: *Acidic rain, *Hydrogen ion concentration, Precipitation(Atmospheric), *Water pollution effects, Laboratory tests, *Toxicity, *Daphnia, Chemical properties, Water properties, Neutralization, Water pollution sources, Water pollution, Water quality, Acid streams, Bioassay, Aquatic animals, Aquatic life, Crustaceans, Research and development, Assay.

The principal objective of this study was to investigate the sensitivity of freshwater microcrustaceans to stress associated with acid rain. All experiments were performed in large (50-gallon) aquaria in order to have satisfactory pH control, to be able to use sufficient numbers of replicates for each pH treatment, and to be sufficient to make small additions of sulfuric acid since the test water had low alkalinity. The potential effect of acid rain on Daphnia pulex (Crustacea: Cladocera) was studied in laboratory populations subjected to exposures for 1, 12, 24, 48, and 96 hours at pH levels ranging from 4.0 to ambient (6.6). After the exposure duration, daphnids were transferred to control water and observed after 3, 6, 12, 24 hours, and every 24 hours thereafter up to ten days. The experimental design was such that the interaction of dosage and exposure time could be separated. Daphnia pulex appeared to be severely affected by pH of 4-4.5. The study resulted in the development of a satisfactory test system for examining acid stress in laboratory populations of freshwater crustaceans. (Zielinski-IPA)

SUBLETHAL EFFECTS OF POLLUTANTS: LIFE TABLE EVALUATION OF CHRONIC EXPOSURE OF EURYTEMORA AFFINIS (COPEPODA) TO KEPONE,
Maryland Univ., College Park. Dept. of Zoology.
J. D. Allan, and R. E. Daniels.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185209, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, November, 1980. University of Maryland Water Resources Research Center Technical Report No 61. 16 p, 5 Fig, 2 Tab, 27 Ref. OWRT-B-035-MD(1), 14-34-0001-0265.

Descriptors: *Pesticide toxicity, *Organic pesticides, *Fishkill, *Copepods, Growth rates, Bioassay, Water analysis, Water pollution sources, Pesticides, Chlorinated hydrocarbon pesticides, Agricultural chemicals, Chemicals, Balance of nature, Toxicity, Pesticide residues, Public health, Aquatic animals, Aquatic life, Period of growth, Assay, Laboratory tests.

It is generally recognized that chronic exposure to toxins may be deleterious at concentrations well below those identified as lethal in short-term, acute toxicity tests. Previously the authors had hypothesized that the intrinsic rate of natural increase (r), calculated from the life table equation, is an ecologically-meaningful bioassay and a useful protocol for toxicity tests. The r statistic is based on survivorship and fecundity, and is a measure of a population's capacity to increase in an unlimited environment. In the present study, life table estimates of r were used to assess effects of chronic exposure of the estuarine copepod Eurytemora affinis to Kepone. Acute toxicity was determined to be 40 micrograms/liter (mcg/l). A reduction in r was observed in all Kepone concentrations above 5 mcg/l, and r was near zero at 20 mcg/l. This was due to the combination of lowered survivorship, delayed onset of reproduction, and reduced fecundity. The value of the life table approach was discussed both as an experimental protocol and an ecologically realistic bioassay of chronic effects. As little as 21 days is an adequate test period. (Zielinski-IPA)

EFFECTS OF SALINITY STRATIFICATION AND ADVERSE WATER QUALITY ON THE BENTHIC INVERTEBRATE COMMUNITY OF SOUTHERN LAKE PONTCHARTRAIN, LOUISIANA,
New Orleans Univ., LA. Dept. of Biological Sciences.
J. A. Junot.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185290, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, August, 1979. 73 p, 8 Fig, 10 Tab, 67 Ref. OWRT-A-045-LA(3).

Descriptors: *Salinity currents, Impaired water quality, *Benthic fauna, *Louisiana, *Aquatic populations, *Stratification, Salinity, Water currents, Density currents, Chemical properties, Water quality, Water pollution effects, Aquatic animals, Benthos, Fauna, Benthic environment, Environment, Ocean bottom, Annelids, Aquatic life, Chemical stratification, *Lake Pontchartrain.

The benthos of southern Lake Pontchartrain in Louisiana was studied from July 1976 to July 1978, with seasonal sampling of seven off-shore stations and of three stations in the New Orleans Marina complex. The offshore stations were located along a west-to-east transect from the Lake causeway to the Inner Harbor Navigation Canal, following a gradient of increasing salinity stratification and decreasing bottom dissolved-oxygen values. Faunal differences between the stations were examined, using indices of diversity, biological dominance, pollution, and station homogeneity. Fauna of the Marina stations had low species diversity, and were dominated by annelids, indicating an area of poor water quality. Fauna of stations near the Navigation Canal were similar to the Marina stations. Stations to the west of the Canal showed an increased species diversity, and the fauna were dominated by molluscs. The observed faunal differences along the east-to-west transect appeared to be due to poor bottom water quality as a result of the salinity stratification. (Zielinski-IPA)

PHYSICAL ENVIRONMENT AND HYDROLOGIC CHARACTERISTICS OF COAL-MINING AREAS IN MISSOURI,
Geological Survey, Rolla, MO. Water Resources Div.
J. E. Vaill, and J. H. Barks.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-126765, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-67, 1980. 33 p, 12 Fig, 2 Tab, 48 Ref.

Descriptors: *Environmental effects, *Coal mines, *Water quality, *Hydrogeology, *Missouri, Acid mine water, Mine drainage, Groundwater, Surface waters, Water pollution effects, Groundwater movement, Water analysis.

Hydrologic information for the north-central and western coal-mining regions of Missouri is needed to define the hydrologic system in these areas of major historic and planned coal development. This report describes the physical setting, climate, coal-mining practices, general hydrologic system, and the current (1980) hydrologic data base in these two coal-mining regions. Streamflow in both mining regions is poorly sustained. Stream water quality generally varies with location and the magnitude of coal-mining activity in a watershed. Streams in non coal-mining areas generally have dissolved-solids concentrations less than 400 milligrams per liter. Acid-mine drainage has seriously affected some streams by reducing the pH to less than 4.0 and increasing the dissolved-solids concentrations to greater than 1,000 milligrams per

liter. This has resulted in fish kills in some instances. Groundwater movement is impeded both laterally and vertically in both mining regions, especially in western Missouri, because of the low hydraulic conductivity of the rocks of Pennsylvanian age. The quality of groundwater varies widely depending on location and depth. Groundwater commonly contains high concentrations of iron and sulfate, and dissolved-solids concentrations generally are greater than 1,000 milligrams per liter. (USGS)

SALT MARSH CREATION: IMPACT OF HEAVY METALS,
Skidaway Inst. of Oceanography, Savannah, GA.
W. S. Gardner.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC. Report FWS/OBS-80/27 November, 1980, p 126-131. 2 Fig, 11 Ref.

Descriptors: *Heavy metals, *Salt marshes, *Marsh management, *Water pollution, Estuarine environment, Coasts, Dredging, Sediments, Water chemistry, Mercury, Mercury compounds, Food chains, Marsh plants.

The impact of heavy metals on marshes depends on the composition, distribution, availability, and biological effects of the metals in the sediments and water at the site. Estuaries can often be considered as funnels for the transport of pollutants to the sea, but some parts of the estuarine system, such as salt marshes, may also act as filters for pollutants. In addition to continental input through rivers, metals can be introduced into coastal regions by local sources of pollution, including industrial effluents and dredging. The total concentration of a heavy metal in an estuary or marsh may not determine its availability or toxicity to organisms. Occluded minerals may not be biologically available, while metals dissolved in the water or loosely sorbed to particles are directly available. If a system is in equilibrium, thermodynamic processes determine the distribution of the metal in the solid, liquid, or gaseous phases. Equally important in most natural systems are kinetic processes which control the physical, chemical, and biological distribution in the marsh estuarine system. During dredging, operations, normally reduced sediments are exposed to oxygen and a series of reactions affecting heavy metal concentrations can occur. Plants may affect movement of metals by removing them from solution or transferring them from one compartment to another. Studies suggest that metals are not taken up and retained by plants in the marsh to the extent that they occur in the sediments; however, mercury may be an exception. Methyl mercury is of particular interest because: it is highly toxic to higher organisms, it can be formed from other forms of mercury in the sediments, and it tends to be concentrated by food chain amplification. (Moore-SRC)
W81-02538

MARSH CREATION: IMPACT OF PESTICIDES ON THE FAUNA, USE OF INFRARED PHOTOGRAPHY, DITCHING AND DIKING,
Georgia Dept. of Natural Resources, Brunswick, Coastal Resources Div.
R. J. Reimold.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 132-135. 2 Ref.

Descriptors: *Marsh management, *Pesticides, *Water pollution, *Aquatic animals, Coasts, Wetlands, Estuarine environment, *Georgia, Species diversity, Infrared imagery, Aerial photography, Drainage ditches, Toxaphene.

Species diversity is used as an indication of the effects of toxaphene on the fauna of two estuarine systems. Brunswick Estuary in Georgia receives toxaphene from a manufacturing plant and from agricultural runoff. The Duplin Estuary is a pristine estuary, part of a National Estuarine Sanctuary. The study covers the period 1968-1976. Except for the early years of the study (1968-1971), no measurable quantities of toxaphene were found anywhere except very close to the manufacturing plant. Since the study began, the levels of toxaphene in the manufacturing plant effluent decreased from parts per hundred to parts per billion. There was a dramatic change both in the number of species and in the number of individuals over the years. The diversity indices for Terry Creek, the stream into which the toxaphene effluent was discharged, revealed that in 1968 there were only three different kinds of organisms, as opposed to nearly 25 species by 1976. Biomass also increased with time. After the first three years, the number of species remain more constant in the Brunswick Estuary than it did in the natural Duplin Estuary. Color infrared aerial photography is useful for ecological delineation and for economic delineation including legal purposes. Ditching and diking for habitat creation and mosquito control have a variety of effects on marshes. Ditching reduces the water level, can cause invasion of upland species, and reduces the area of vegetated wetland. Another problem with ditching is the creation of cat clays. The various consequences of alteration of the salt marsh ecosystem should be evaluated when ditching or diking is being considered. (Moore-SRC)
W81-02539

MARSH CREATION: EFFECTS OF PESTICIDES ON THE FLORA,
Delaware Univ., Lewes. Coll. of Marine Studies.
J. L. Gallagher.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 136-139. 11 Ref.

Descriptors: *Marsh management, *Pesticides, *Marsh plants, Coasts, Wetlands, Ecosystems, Fungicides, Herbicides, Insecticides, Food chains, Pest control, Pesticide residues, Environmental effects, Ecosystems.

Marsh managers must contend with two kinds of situations at the ecosystem level with respect to pesticides. In the first situation, the marsh is the target for pesticide application, and in the second, the wetland ecosystem is the recipient of an accidental spill. At the ecosystem level there is a two by two matrix of situations to consider: target or nontarget exposure, and direct or indirect effects. It appears that there is a trend toward an agricultural type of management of coastal ecosystems, which may be a prelude to the kinds of insect and disease situations experienced in agriculture. This may lead to an increased use of insecticides, herbicides and fungicides where the marsh is the target ecosystem. The examination of a few actual cases of pesticide-marsh flora interactions and several hypothetical cases points out the complexities of the problem of pesticides in the wetlands. Basic knowledge of wetland processes will aid in theorizing the fate and trophic transfer in the food chain. Once these are identified, they must be tested with various pesticides. If it is determined that potentially serious problems exist in situations where wetlands are the target ecosystems, they can be avoided by changing the management practice. The uncontrolled situation is that where the wetland is a nontarget ecosystem. Methods of ameliorating such interaction should receive research priority. (Moore-SRC)

NUTRIENT CYCLING IN COASTAL ECOSYSTEMS,
Georgia Univ., Athens. Inst. of Ecology.
L. R. Pomeroy.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 140-147. 3 Fig, 16 Ref.

Descriptors: *Coasts, *Cycling nutrients, *Estuarine environment, Food webs, Productivity, *Ecosystems, Eutrophication, Salt marshes, Aquatic plants, Nitrogen, Phosphorus, Carbon, Sulfur, Water pollution, Bacteria.

Most estuarine situations or other coastal areas, especially those with macroscopic plants, are regions of high primary productivity. That leads into the question of nutrient supply, because to maintain high productivity, plant nutrients must be sufficient. The high productivity of coastal systems in many cases depends heavily on recycling of phosphorus, rather than on a continued supply of new phosphorus into the system. The major role of bacteria in the phosphorus cycle may be scavenging phosphorus, and turnover time of bacteria is probably a matter of one day in most systems. The result is that phosphate moves through both phytoplankton and the bacteria to filter-feeding consumers and benthic deposit feeding consumers. By the time food has gone through the first level of carnivores, 90% or more of the phosphate has been excreted. There is an inflow of phosphorus from rivers to coastal waters, and phosphorus from rivers to coastal waters, and phosphorus also comes from the ocean, so that phosphorus is not an element that is limiting in coastal zone water. One of the biggest differences in nitrogen cycles is that the main reservoir of nitrogen is the atmosphere. Carbon is rarely a limiting element in the coastal zone. The coastal highly productive zones are probably regions of relatively high input of sulfur to the atmosphere. Elements such as nitrogen and phosphorus are key elements in aquatic coastal systems both as limiting factors and as causes of eutrophication. (Moore-SRC)
W81-02541

SALT MARSH CREATION: IMPACT OF SEWAGE,
Georgia Univ., Sapelo Island. Marine Inst.
E. Haines.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 148-153. 2 Fig, 17 Ref.

Descriptors: *Salt marshes, *Sewage sludge, *Water pollution effects, *Marsh plants, Wetlands, Coast, Fertilizers, Water quality, Estuarine environment, Algae, Waste disposal, Productivity, Nitrogen, Phosphorus, Nutrients.

Increasing amounts of sewage are being deposited in coastal wetlands. A lot of the sewage has not even had primary treatment, and the increasing biological oxygen demand in coastal wetlands has already resulted in marked deterioration of water quality in some estuaries. The impact of applying sewage sludge on the nitrogen cycle in marshes was evaluated in two separate studies, one in Massachusetts, and one in Georgia. Sewage fertilization increases the plant biomass, but does not stimulate belowground growth, and may decrease root growth in salt marshes. Addition of sewage fertilizer may decrease the rate of nitrogen fixation, and increase denitrification. The rate of benthic algal production was actually decreased in Massachusetts, as a result of the increased standing plant biomass shading the algae. Marsh plants and benthic algae have high rates of production and can assimilate some nutrients. The clay soils in Georgia estuaries can accumulate a lot of phosphate. The marsh is a fairly stable community and appears to be quite resilient, at least to enrichment stresses. In some respects the salt marsh is a good tertiary treatment facility. (Moore-SRC)

EFFECT OF SEWAGE AND INDUSTRIAL WASTES ON THE FLORISTIC COMPOSITION AND DISTRIBUTION OF MACROPHYTIC VEGETATION IN THE RIVER KHAN,
Vikram Univ., Ujjain (India). School of Studies in Botany
S. V. R. Rao, and L. P. Mall.
Water Research, Vol 15, No 2, p 287-288, February, 1981. 2 Tab, 2 Ref.

Descriptors: *Rivers, *Macrophytes, *Sewage effluents, Plant populations, Biomass, Environmental effects, Industrial wastes, Water pollution effects, Seasonal, Aquatic plants, *India, Discharge, Khan River.

The effects of industrial wastes and sewage on the tropical river Khan originating near Indore, India were examined at 9 sampling stations downstream from the waste discharge site. Increased macrophyte species occurred at stations 2 and 3, about 10 kilometers downstream of the discharge site, with returns to normal floristic composition at the remaining sampling stations. The winter and summer mean biomass values of the macrophytic vegetation were also greatest at the third sampling station, with Vallisneria spiralis, Polygonum glabrum and Potomogeton pectinatus providing most of the biomass. Results of these vegetation studies on the river Khan were similar to those reported for the effects of waste water discharge on the New River of Virginia, which reported decreases in the number of species by over one half at the site of effluent discharge and drastic reductions in the biomass of the major vegetational components at the points of the major effluent discharges. These findings indicate that the discharge of sewage and industrial wastes has a deleterious effect on the floristic composition and biomass of the macrophytic vegetation in the river Khan. BIOCONCENTRATION OF LINEAR ALKYLBENZENE SULFONATE (LAS) IN BLUEGILL (LEPOMIS MACROCHIRUS),
Soap and Detergent Association, Wareham, MA.
R. A. Kimerle, K. J. Macek, B. H. Sleight, III, and M. E. Burrows.
Water Research, Vol 15, No 2, p 251-256, February, 1981. 3 Fig, 3 Tab, 14 Ref.

Descriptors: *Sunfishes, *Absorption, *Alkylbenzene sulfonates, Biodegradation, Metabolism, Surfactants, Water pollution, Domestic wastes, Kinetics, Pollutants, Public health, Toxicity, Fish toxins, Laboratory tests, Water pollution sources, Detergents, Fish, *Bluegills.

As a component of many household laundry detergents, linear alkylbenzene sulfonate (LAS) is a common constituent of domestic waste waters and has the potential of reaching surface waters. Although the anionic surfactant is readily degraded to carbon dioxide and water by bacteria, it is necessary to examine bioconcentration of the compound in edible aquatic species to determine any possible adverse health effects to man. Bluegill, Lepomis macrochirus, were exposed for 35 days to a mean C14-LAS concentration of 0.5 milligrams/liter, followed by 14 days of depuration. The steady state whole body bioconcentration factor (BCF) was estimated as 104 when all radioactivity was assumed to be intact LAS. Muscle BCF was 36 and gall bladder BCF was 5000. BCF's for liver, gills, viscera, blood and the remaining carcass ranged from 64 to 283. Rapid clearance of C14 activity from all organs and tissues was observed with half-lives of 2-5 days. Results were in agreement with other LAS studies in the literature and suggested metabolism of the surfactant to simpler products. On the basis of these experiments it was concluded that LAS posed no threat as a fish contaminant at the levels found in surface waters. (Geiger-FRC)

AN APPROACH FOR THE EVALUATION OF EFFICACY OF WETLANDS-BASED PHOSPHORUS CONTROL PROGRAMS FOR EUTROPHICATION-RELATED WATER QUALITY IMPROVEMENT IN DOWNSTREAM WATERBODIES,
Colorado State Univ., Fort Collins. Environmental Engineering Program.
R. A. Jones, and G. F. Lee.
Water, Air, and Soil Pollution, Vol 14, p 359-378, 1980. 5 Fig, 5 Tab, 25 Ref.

Descriptors: *Eutrophication, *Phosphorus compounds, *Nitrogen compounds, Nutrients, *Lake Okeechobee, Florida, Lakes, *Wetlands, Phosphates, Algae, Water quality, Shallow water, Aquatic plants.

A study of available information on eutrophication of Lake Okeechobee indicated that the proposed re-creation of marshes and wetlands may have little positive impact on the water quality of the lake. Present data on nutrients in the system show a confused picture, and further studies are needed on amounts and available forms of N and P during the summer growing season. The role of color as a factor in limiting algal growth should be determined. If it is significant, then control of phosphorus loading through wetlands restoration would have little effect on the lake's water quality. The long hydraulic residence time (1 year) permits nutrients released from the wetlands to accumulate in the lake, producing a net P balance unless aquatic plants are harvested. The Vollenweider Organization for Economic Cooperation and Development model appears to be useful for predicting the planktonic algal chlorophyll response to P loading in Lake Okeechobee. Based on limited data, a 50% total P load reduction to the lake would result in a decrease from 31 to 22 micrograms per liter of chlorophyll, a noticeable improvement in water quality; a 10% decrease, an undetectable change. DECISION PROBLEMS IN THE CONTROL OF ACID PRECIPITATION: NONCONVEXITIES AND IRREVERSIBILITIES,
Wyoming Univ., Laramie. Dept. of Economics.
T. D. Crocker, and B. A. Forster.
Journal of the Air Pollution Control Association, Vol 31, No 1, p 31-37, January, 1981. 5 Fig, 2 Tab, 34 Ref.

Descriptors: *Cost-benefit analysis, *Aquatic habitats, *Acidic water, *Acid rain, Decision making, Benefits, Economics, Fish, Aquatic animals, Precipitation(Atmospheric), Curves, Mathematical studies, Graphical analysis, Water pollution control, Air pollution, Hydrogen ion concentration, Environmental effects, Ecology.

The nonconvexities and irreversibilities in the dose-response functions for the ecological effects of acid precipitation must be considered in evaluating cost vs. benefits of controlling acid gases from fossil fuel combustion. When decisions are based on current market prices alone, the economic damage to an ecosystem may be underestimated. The presently used compromise control measures, where a certain level of environmental harm is allowed to obtain benefits of moderately increased fossil fuel combustion, may be an undesirable policy. This system suggests that there are some aquatic systems which are irreversibly acid. Corrective costs would greatly exceed potential benefits. This situation can be prevented by collecting sufficient information before beginning or continuing any acid producing activity. Systems on the verge of acidification should receive first consideration. (Cassar-FRC)

MICROBIOLOGICAL PARAMETERS FOR DIFFERENTIATING BETWEEN COASTAL AND OPEN WATERS IN THE NORTHERN BALTIC PROPER AND THE GULF OF FINLAND,
Zoological Station, Tvarminne.
P. Vaatanen.
Journal of Applied Bacteriology, Vol 49, No 3, p 455-462, December, 1980. 2 Fig, 6 Tab, 13 Ref.

Descriptors: *Marine bacteria, *Bioindicators, Aquatic microbiology, Water pollution effects, Environmental effects, *Baltic Sea, Aquatic environment, Littoral, Aquatic populations, Sediments, Oceans, Sea water, Yeasts.

Microbial populations from three sites in the Tvarminne archipelago of the Baltic Sea, two inshore and a third (Ajax) offshore, were compared with populations from four sites representing the offshore areas of the northern Baltic proper and the entrance to the Gulf of Finland. The purpose of these investigations, which were made during four research cruises in 1977-78, was to discover which microbiological parameters reveal terrestrial and littoral effects on the marine ecosystem. Microbial populations consistently decreased with increasing distance from the shore. The effects of terrestrial runoff, outflows from littoral areas and sediments were observed in the two Tvarminne inshore areas in the bacteria viable at 18C and the polymyxin-resistant bacteria, rods, and bacterial spores. Effects of these factors were not found in the Ajax area. The offshore microbial populations were characterized by vibrios and bacteria in a starved state. Neither offshore nor inshore conditions were indicated by proteolytic bacteria or yeasts. (Geiger-FRC)

INITIAL EFFECTS OF AMOCO CADIZ OIL ON INTERTIDAL ALGAE,
Brest Univ. (France). Inst. of Marine Studies.
J. Y. Floc'h, and M. Diouris.
Ambio, Vol 9, No 6, p 284-286, 1980. 6 Fig, 3 Ref.

Descriptors: *Amoco Cadiz, *Algae, *Marine algae, *Oil spills, Ecology, Marine plants, Intertidal areas, Aquatic algae, Phaeophyta, Chlorophyta, Rhodophyta, Environmental effects, Plant growth, Water pollution effects, Zonation, Vertical distribution, Distribution, Oil pollution, Ships, *France.

Fresh oil contacting algae after the Amoco Cadiz spill acted as a contact herbicide, bleaching the most sensitive filamentous green thalli (Cladophora and Chaetomorpha). Red algae developed local necrosis, and the sensitive brown algae developed widespread necrosis. Later exposure to weathered oil further weakened the plants, causing death of some species. Algae at higher tide levels in sheltered areas suffered drastic losses immediately after the spill, and losses continued for at least 8 months. A red alga, Rhodothamniella floridula, was replaced by a green alga, Enteromorpha. Lyngbya confervoides, a member of the Oscillatoriaceae, replaced the filamentous green algae, Cladophora and Chaetomorpha. At mid and lower tide levels, plants suffered less, especially those which remained immersed. Some less sensitive plants appeared stiffer, had periods of zero growth, and had weakened adhesion. Some changes in vertical zonation were possibly caused by changes in herbivore population. (Cassar-FRC)

MICROBIAL BIODEGRADATION AND CHEMICAL EVOLUTION OF OIL FROM THE AMOCO SPILL,
Montana State Univ., Bozeman. Dept. of Microbiology.
D. M. Ward, R. M. Atlas, P. D. Boehm, and J. A. Calder.
Ambio, Vol 9, No 6, p 277-283, 1980. 6 Fig, 4 Tab, 55 Ref.

Descriptors: *Microbial degradation, *Degradation(Decomposition), *Oil spills, Bacteria, Amoco Cadiz, Biodegradation, Chemical reactions, Oil pollution, Water pollution effects, Environmental effects, Ships, *France, Persistence.

Microbial degradation of oil spilled in the Amoco Cadiz wreck was not uniform because of the complex chemical composition of the oil and the variation in environmental conditions. Volatile materials evaporated or dissolved soon after the spill. Bacteria increased rapidly (at one site, from 96 million to 630 million total bacteria per gram; from 520 to 14 million hydrocarbon utilizing bacteria per gram) to digest the more easily degraded components, n-alkanes. Branched and cyclic aliphatic and aromatic components degraded more slowly. In aerobic, nutrient rich environments, 80% of the hydrocarbons were gone in 7 months. However, anaerobic conditions which are prevalent in sedi-

ments produced 5% degradation in 233 days in laboratory tests. Since some chemicals are not biodegradable and others remain in environments unfavorable to degradation, about 20% of the oil components may persist for a long period. (Cassar-FRC)

THE AMOCO CADIZ OIL SPILL: AN ECOLOGICAL IMPACT STUDY,
Centre Oceanologique de Bretagne. Brest (France).
L. Laubier.
Ambio, Vol 9, No 6, p 268-276, 1980. 9 Fig, 20 Ref.

Descriptors: *Amoco Cadiz, *Oil spills, *Ecology, *Environmental effects, Aquatic life, Ships, Oil pollution, Water pollution sources, Water pollution effects, Marine animals, Marine plants, Biodegradation, Transportation, *France, Shores, Seashores, Tidal waters.

When the Amoco Cadiz ran aground 1.5 nautical miles from shore at Portsall, Brittany, France, on March 16-17, 1978, 223,000 tons of crude oil were rapidly spilled into the ocean within 14 days. The toxic aromatic fraction was high, 30-35%. Prevailing winds at that time ensured that most of the oil reached the coast rather than remaining at sea. Immediately after the wreck, the French Ministry of the Environment began preparations for a 3-year study to monitor the chemical quality of the water, sediment, and marine organisms; study the ecological effects; and investigate microbial biodegradation processes. More than 2 years after the spill, the environment has largely recovered in areas where waves, currents, and wind work freely. Oil remains in the protected areas and is slowly undergoing microbial degradation. In addition to large numbers of marine animals lost initially, there are as yet unquantified sublethal and reproductive effects. Food chain alterations are not completely understood. The 3-year study program has been complicated by another oil spill in March, 1980. Nevertheless, it is believed that the first 2 years of study yielded about 80% of the expected information. POLLUTION OF SUBTIDAL SEDIMENTS AND DISTURBANCE OF BENTHIC ANIMAL COMMUNITIES,
Station Biologique de Roscoff (France).
L. Cabioch.
Ambio, Vol 9, No 6, p 294-296, 1980. 3 Fig, 14 Ref.

Descriptors: *Amoco Cadiz, *Oil spills, *Benthic fauna, *Amphipoda, Marine animals, Water pollution effects, Sediments, Bottom sediments, Aquatic life, Crustaceans, Mollusks, Invertebrates, Ecology, Environmental effects, Ships, *France, Oil pollution.

The sublittoral zone was most affected by dissolved hydrocarbons and oil particles, free and adsorbed onto sediment, after the oil spill from the Amoco Cadiz wreck. In the first few weeks, bottom fauna living on the sediment surface were more adversely affected than burrowing fauna. Suspension and deposit feeders did not suffer from ingesting particles; the dissolved hydrocarbons were more harmful. The populations suffering the worst damage were inshore, at depths less than 30 meters, and living in fine sediments. An example is a community of Abra alba, a bivalve, and Ampelisca, an amphipod. About 40% of the total biomass was lost immediately after the spill. Some species were completely destroyed--amphipods, some mollusks, and sea urchins. At one severely polluted site, out of a total of 100 species, 11 were eliminated and 17 decreased in abundance. Repopulation has been difficult for some species, especially for those with no pelagic larvae. (Cassar-FRC)

5D. Waste Treatment Processes

WATER RECLAMATION BY COMBINED ELECTRODIALYSIS/ULTRAFILTRATION,
Aqua-chem, Inc., Milwaukee, WI.
B. Schneider.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-188559, Price codes: A10 in paper copy, A01 in microfiche. Final Report, Prepared for Office Water Research and Technology, April, 1980. 190 p. OWRT-C-80308-S(No 8575)(1), 1434-0001-8575.

Descriptors: *Water reuse, *Waste water treatment, *Membranes, *Tertiary treatment, *Electrodialysis, Water quality control, Water purification, Water reclamation, Filtration, Research and Development, Waste water(Pollution), Water pollution, Waste treatment, Reclamation, Dialysis, Separation techniques, Treatment, Membrane processes, Salts, Aquatic bacteria, Organic wastes.

It has been demonstrated that the combined use of electrodialysis (ED) and ultrafiltration (UF) in the same module represents a functional process for treating secondary effluents from conventional waste treatment processes. In this process, UF membranes afford separation and concentration of colloidal suspensions of bacteria and organics from the water and salts present in the solution. The UF membranes are located between ED membranes which form the depleting cells of a typical ED module, forming two depletion cells for every concentration cell. The ED membranes separate and concentrate the salts present in the secondary effluent, with fractionation into three solutions: (1) collodially-suspended materials, (2) a concentrated salt solution, and (3) the water with a portion of the original salt concentration and the dissolved organics. It would be more economical to employ UF and ED as separate processes to accomplish the tertiary treatment of a secondary effluent. A method for evaluating the overall performance of UF membranes is described. (Zielinski-IPA)

INVESTIGATION OF FULL-SCALE BIOLOGICAL BATCH TREATMENT OF INTERMITTENT WASTE WATER FLOWS,
Maryland Univ., College Park. Dept. of Civil Engineering.
J. E. Alleman, and S. P. Lo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185233, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, December, 1980. University of Maryland Water Resources Research Center Technical Report No 63. 31 p, 16 Fig, 1 Tab, 7 Ref. OWRT-A-052-MD(1), 14-34-0001-0122.

Descriptors: *Waste water treatment, Feasibility studies, *Aeration, *Activated sludge, *Biological treatment, Water pollution sources, Intermittent streams, Treatment, Municipal wastes, Waste treatment, Waste water(Pollution), Waste water disposal, Sludge, Aerobic bacteria, Biodegradation, Microbial degradation, Sludge treatment, Solids contact processes, Feasibility, Water quality, *Maryland, Greenbrier State Park.

An existing full-scale extended aeration waste water treatment plant, located at Greenbrier State Park, was modified to provide batch or intermittent discharge operation. Following modification, this plant was maintained in this operational mode for over a month, while successfully meeting all applicable NPDES permit criteria. It was believed that this periodic strategy for waste water treatment systems offers a potential for improved operation, manpower needs, and resistance to transient influent loads. Some aeration problems were experienced, in that since batch handling resulted in variable aeration tank volume, the existing high power (20HP) mechanical unit was not functional since it operated at fixed free water surface height. Addition of a supplemental bubble diffuser lacked sufficient blower horsepower (3 HP) for complete solids entrainment. Solids that settled went septic and became buoyant due to release of nitrogen via denitrification. The problem was alleviated by use of sub-surface effluent withdrawal, but sub-optimal performance was reflected. (Zielinski-IPA)

AQUIFERS AS PROCESSING PLANTS FOR THE MODIFICATION OF INJECTED WATER,
Louisiana State Univ., Baton Rouge. Dept. of Geology.
J. S. Hanor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185332, Price codes: A05 in paper copy, A01 in microfiche. Louisiana Water Resources Research Institute, Louisiana State University, Bulletin 11, August, 1980. 81 p, 26 Fig, 7 Tab, 47 Ref, 5 Append. OWRT-A-031-LA(6).

Descriptors: *Aquifer systems, *Aquifer testing, *Injection wells, Water purification, *Water treatment, Impaired water quality, Aquifers, Aquifer management, Aquifer characteristics, Bodies of water, Confined water, Water sources, Water supply, Water injection, Inflow, Water quality control, *Louisiana, Coastal aquifers.

Gulf Coast (Baton Rouge) Region aquifer systems offer potential for infested water storage and water composition modification. Study of natural processes on groundwater chemistry provides information on processes potentially influencing water composition during artificial recharge. Baton Rouge area fresh-water aquifer processes include fermentive breakdown of organic matter, sulfate reduction, Donnan behavior, and dissolution/formation of new silicates. Although appearing to be in exchange equilibrium with sediment clay minerals, ion-exchange influences native water composition less than previously thought. Potentially-occurring artificial recharge reactions (carbon dioxide formation and reaction with minerals; ion-exchange; diffusion) were studied. Altering montmorillonite appears to control water composition. Clay contents down to 0.1 weight-% rapidly cause dissolved calcium removal and water softening during simulated injection/storage/production of fresh waters from brackish/saline Gulf Coast aquifers, corroborating field study results. Aquiclude clays soften injected water only if pore water concentrations of calcium and magnesium are less than in injected water. Of a variety of other possible reactions/processes (oxidation-reduction; membrane effects), many are incompletely understood. (Zielinski-IPA)

PILOT PLANT STUDIES OF ROTATING BIOLOGICAL CONTACTORS TREATING MUNICIPAL WASTE WATER,
K. L. Murphy, and R. W. Wilson.
Canada Mortgage and Housing Corporation, Ottawa, Sewage Collection and Treatment Report SCAT-2, July, 1980. 117 p, 41 Fig, 22 Tab, 2 Append.

Descriptors: *Pilot plants, *Design criteria, *Research priorities, *Municipal waste water, *Waste water treatment, Biological oxygen demand, Research facilities, Test facilities, Waste water, Nitrification, Contact beds, Waste water purification, Complete waste water treatment, Design standards, Standards, Water quality, Water quality control, Impaired water quality, Quality control, Specifications.

This 12-month pilot program examined the performance of rotating biological contactors (RBC) for treatment of municipal waste water. Suitable design criteria for removal of BOD-5 and combined BOD-5 plus nitrification were examined. Phosphorus removal, the effects of diurnal and shock loadings, and considerations of process scale-up were also evaluated. The best design parameters for evaluation and sizing of the RBC systems were (1) total BOD-5 mass loading for BOD-5 removal, and (2) filtrable TKN mass loading for combined BOD-5 removal plus nitrifica-

tion. Treated effluent containing filtrable BOD-5 concentrations of less than ten milligrams/liter could be consistently produced. Recommended design loadings were developed, based on a full-scale short hydraulic detention RBC system experiencing a peak-to-mean-to-minimum diurnal flow of 2:1:0.5, with specific application to primary treated municipal waste water. It was concluded that diurnal factors of 1.25 and 1.35, respectively, for BOD-5 removal and combined BOD-5 removal plus nitrification should be used when designing full-scale RBC systems based on steady-state test data. (Zielinski-IPA)

ACTIVATED SLUDGE AND ACTIVATED CARBON TREATMENT OF A WOOD PRESERVING EFFLUENT CONTAINING PENTACHLOROPHENOL,
Department of the Environment, Ottawa (Ontario).
P. H. M. Guo, P. J. A. Fowlie, V. W. Cairns, and B. E. Jank.
Technology Development Report EPS 4-WP-80-2, June, 1980. 77 p, 38 Fig, 16 Tab, 13 Ref, 3 Append.

Descriptors: *Activated sludge, *Activated carbon, Water pollution sources, *Phenols, Chlorinated hydrocarbons, *Waste water treatment, Carbon, *Industrial wastes, Organic compounds, Organic pesticides, Preservation, Activated sludge process, Sludge, Adsorbents, Pollutants, Water pollution effects, Water pollution control, Water quality control, Water quality, Copper compounds, Creosote, Wood preserving industry, Ontario.

A comprehensive sampling/monitoring program was undertaken by the Waste Water Technology Centre, Burlington, Ontario, carried out in three phases from November 1977 to May 1978 at the activated sludge (AS) system at Abitibi-Northern Wood Preserves Limited (using creosote, pentachlorophenol (PCP), and chromated copper arsenate (CCA)), at Thunder Bay, Ontario. Phase 1 involved monitoring and upgrading the existing full-scale AS system; phase 2, treatment of the AS effluent by a granular activated carbon column system; phase 3, by-pass of the AS system and, following oil separation and flow equalization, waste water treatment in the activated carbon system. Waste water treatment after oil separation and flow equalization by extended aeration AS gave good removal of organics, but only 35% of the PCP, resulting in a toxic effluent to rainbow trout. Treatment of the AS effluent by carbon adsorption resulted in effective PCP removal and non-toxic effluents. Activated carbon treatment of waste water after oil separation and flow equalization gave good removals of organics and PCP. (Zielinski-IPA)

ADVANCED WASTE TREATMENT OF INDUSTRIAL WASTE WATERS FOR NON-POTABLE REUSE USING MOBILE TREATMENT UNITS,
Rexnord, Inc., Milwaukee, WI. Environmental Research Center.
R. Osantowski, A. Geinopolos, J. Kane, G. Rollinger, and R. Wullschleger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189805, Price codes: A20 in paper copy, A01 in microfiche. Office of Water Research Technology Report OWRT/RU-80-5, January 1, 1981. 442 p, 57 Fig, 137 Tab, 33 Ref, 7 Append. OWRT-C-90084-R(No 7805)(2), 14-34-0001-7805.

Descriptors: *Waste water treatment, *Pilot plants *Water quality control, *Water reuse, Technology, Advanced waste water treatment, Water treatment facilities, Waste water facilities, Water treatment, Water pollution control, Waste water management, Waste water pollution, Waste water, Process control, Water quality, Treated water, Water use, Ion exchange, Reverse osmosis, Electrodialysis.

A pilot plant program was conducted to study the applicability of advanced treatment methods (chemical treatment, filtration, activated carbon sorption, ion-exchange, reverse osmosis, and electrodialysis, singly and/or in combination) for industrial waste waters, and was performed using mobile treatment facilities containing desalting and pretreatment equipment. The study, generated at three industrial sites (paper mill; food products plant; an organic chemicals complex), evaluated the advanced waste treatment methods for upgrading secondary effluent for non-potable industrial reuse. These methods removed residual contaminants such as dissolved and suspended solids, BOD-5, TOD, COD, and color. It was concluded that : (1) chemical treatment and dual media filtration effectively removed residual suspended solids and served as an effective pretreatment requisite for other methods studied; (2) activated carbon reliably removed soluble organics in providing pretreatment for the ion-exchange and electrodialysis processes; and (3) all of the desalting techniques studied, ion-exchange, reverse osmosis and electrodialysis are capable of producing a high quality, low dissolved solids water suitable for non-potable industrial reuse. All of these advanced technologies would require suitable pretreatment. (Zielinski-IPA)
W81-02489

LIGNITE LIQUEFACTION WASTE WATER: SUITABILITY FOR REUSE AND CLEAN UP FOR DISCHARGE INTO THE ENVIRONMENT,
North Dakota Univ., Grand Forks. Dept. of Chemistry.
R. J. Baltisberger, and D. E. Bartak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-189813, Price Codes: A04 in paper copy, A01 in microfiche. Technical Completion Report, 1979. 44 p, 7 Fig, 11 Tab, 11 Ref. OWRT-C-7188(No 6218)(1).

Descriptors: *Waste water treatment, *Lignite, *Liquefaction, Waste water, Chemical compounds, Phenol, Ammonia, Polynuclear aromatic hydrocarbons, Extraction, Vaporization, Biological treatment, Byproducts, Leaching.

Treatment of waste waters produced by a lignite liquefaction process development unit is described. Approximately fifty pounds of waste water are generated for every 100 pounds of lignite (MAF basis) in the production of Solvent Refined Lignite. The principle chemical compounds present in the waste water were: phenol, 3,000-5,000 ppm; cresol, 2,000 ppm; methanol, 3,000 ppm; acetone, 3,000-5,000 ppm; ammonium ion, 3,000-5,000 ppm; acetate ion, 10,000-15,000 ppm; and bicarbonate ion, 2,000-6,000 ppm. Heavy metal cation concentrations were less than 1 ppm and a few polynuclear aromatic hydrocarbons (phenanthrene, methylphenanthrene,and pyrene) were present in concentrations less than 10 ppm. The most effective method of treating the waste water is: (1) a solvent extraction step to reduce the high phenol and cresol concentration to a few 100 ppm, (2) a vaporization of ammonia produced by adjustment of the waste water to pH 12, (3) adjustment to pH 6.5 with the remaining phenol removed by biological degradation, (4) final charcoal filtration to remove the last traces of phenol to a few ppb level. A by-product of the solvent refining process was filter cake containing too high a concentration of unremoved SRL and unreacted coal (about 60% carbon) to be buried at a mine site, because of economic considerations. The filter cake was ashed in a manner to duplicate the conditions in a slagging gasifier for the production of CO and H2. The resulting ash was then leached with water in column experiments to stimulate percolation of groundwater through mine buried ash obtained from the gasifier. No extensive quantities of ions were added to the leachate in the process.

EVALUATION OF SORBENTS FOR INDUSTRIAL SLUDGE LEACHATE TREATMENT,
New Jersey Inst. of Technology, Newark.
P. C. Chan, J. W. Liskowitz, A. Perna, and R. Trattner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-205800, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-052, June, 1980. 56 p, 15 Fig, 10 Tab, 17 Ref, 1 Append. R 803717 02.

Descriptors: *Leachates, *Industrial wastes, *Sludge disposal, *Waste water treatment, Calcium compounds, Zeolites, Kaolinite, Illite, Fly ash, Lysimeters, Landfills, Clays, Costs.

Ashes, clays, and refined materials were tested under laboratory and pilot-scale conditions to determine their capacity to remove leachate contaminants produced from three industrial sludges: calcium fluoride, metal hydroxide, and petroleum. Rather than a single sorbent, a combination of acidic and basic sorbents is required in a layered system for removal of all the measurable contaminants from the leachates. These combinations are illite, vermiculite, and a natural zeolite for the acidic leachate; illite, acidic fly ash for the neutral leachate; and illite, kaolinite, and a natural zeolite for the alkaline leachate. The sorbent capacities exhibited by the natural sorbents are comparable to those exhibited by refined sorbents. The outdoor pilot study, which was limited to the treatment of the calcium fluoride sludge leachate, using lysimeters, some 80 times larger than the laboratory lysimeters, revealed that the sorbent effectiveness depends on the velocity of the leachate through the sorbents and the sorbent removal capacity for specific contaminants. Except for magnesium, effective reductions of the measurable leachate constituents were achieved with the use of illite, acidic fly ash, and a zeolite in the weight ratio of 2:2:1. Sorbent costs have been estimated for various combinations required for treating leachate from calcium fluoride sludge over a ten-year period of landfill operation. For the illite/acidic fly ash/zeolite combination and the illite/acidic fly ash/basic fly ash combination, costs are $1.37 and $0.45 per ton of sludge, respectively. (Moore-SRC)

TRUCK WASHING TERMINAL WATER POLLUTION CONTROL,
Matlack, Inc., Lansdowne, PA.
J. E. O'Brien.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-219090, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-161, June, 1980. 91 p, 22 Fig, 32 Tab, 3 Ref. S803656-01.

Descriptors: *Waste water treatment, *Industrial wastes, *Wash water, Oily water, Pilot plants, Ozone, Ultraviolet radiation, Organic wastes, Chemical treatment, Biological treatment, Chemical oxygen demand, Costs.

A laboratory and pilot-scale investigation of a treatment sequence, including physical, chemical, and biological treatment steps led to a full-scale installation for the treatment of tank truck washing waste water. The system included gravity separation equalization, neutralization, dissolved air flotation, mixed-media filtration, carbon adsorption, and biological treatment. This facility treated 15,000 gallons per day of waste water from the Matlack, truck washing terminal, Swedesboro, New Jersey, for proposed subsequent discharge to a tributary of the Delaware River. Following pretreatment for the removal of suspended solids and insoluble oils and greases, carbon adsorption was used for detoxifying the waste water prior to biological stabilization. The total system demonstrated an overall treatment effectiveness averaging greater than 90% removal of COD and 99% removal of oils and greases and phenolic compounds. The cost of treatment was $48.92 per 1,000 gallons of waste water treated. This equated to a unit cost of $24.46 per trailer cleaned. A toxic substance study indicated that organic compounds were eliminated through the treatment train. A further pilot plant investigation was made to determine if chemical oxidation through the use of ozone or ozone plus

untraviolet could be substituted for activated carbon to reduce COD and transform toxic organics to a biodegradable form. The ozone - ultraviolet process can consistently remove 80 to 90% of the dissolved organics from tank truck cleanings. (Moore-SRC)

ELECTROLYTIC TREATMENT OF OILY WASTE WATER FROM MANUFACTURING AND MACHINING PLANTS,
Ford Motor Co., Dearborn, MI.
R. L. Gealer, A. Golovoy, and M. Weintraub.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-225113, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-143, June, 1980. 57 p, 7 Fig, 12 Tab, 8 Ref. S804174.

Descriptors: *Waste water treatment, *Oily water, *Industrial wastes, Electrolysis, Emulsions, Pilot plants, Coolants, Oil, Cost analysis.

Process waste water from metal working operations contains free or suspended oil and emulsified oil which must be removed before the water can be discharged or reused. These oils originate mainly from parts washer overflow and machining coolant dumping, and the concentration typically ranges from 1,000 to 10,000 ppm as emulsified oil. A continuous electrolytic treatment is being developed to remove the emulsified oil from dilute oily waste water streams. In this process, the waste water permeates through an iron chip bed anode and steel mesh cathode. A potential is applied to the electrodes, forming ferrous ions at the anode and hydroxyl ions at the cathode. The ferrous ions react in a complex manner with the emulsifying agents, destabilizing the emulsion and generating an oil rich floating sludge and essentially oil-free water. A pilot plant unit capable of processing about 5700 1/day (1500 gal/day) was designed, constructed, and evaluated at an actual plant site. Operating parameters and process equipment were evaluated to assess the potential and problems of the process. Waste water with initial oil concentrations in the range of 300 to 7,000 ppm of solvent extractables has been reduced to less than 50 ppm in 90% of the test runs, and to less than 25 ppm in 83%. These test runs were done at conditions of minimum operating cost and minimum sludge generation. When necessary, freon extractables generally are reducible to about 10 ppm or less by the addition of more electrolytically dissolved iron to the system at a small increase in cost. Preliminary economics look favorable and overall results are quite encouraging so that further scale-up of the process is recommended. (Moore-SRC)

UNSLAKED LIME--ITS DIRECT USE IN PHOSPHORUS REMOVAL PROCESSES.
Department of the Environment, Ottawa (Ontario). Waste Water Technology Centre.
Canada-Ontario Agreement on Great Lakes Water Quality, Research Program Project 71-3-1. Research Report No 105, 1980. 24 p, 6 Fig, 14 Tab, 18 Ref.

Descriptors: *Waste water treatment, *Lime, *Phosphorus removal, *Canada, Waste water analysis, Pilot plants, Water quality control, Phosphorus, Phosphates, Water treatment facilities, Waste water facilities, Water treatment, Surface water, Eutrophication, Water pollution control, Water pollution prevention, Waste water pollution, Waste water management, Waste water, Technology, Process control, Water quality.

This study was carried out at the Waste water Technology Centre, Environment Canada, where a 1.5 liter/second (20 imperial gallons/minute) primary treatment plant with a quicklime/dry hydrated lime chemical addition system was built and operated. The study evaluated the use of quicklime for phosphorus removal. It was determined that quicklime may be used in place of hydrated lime without an increase in the lime requirement, provided that the lime slaking temperature was within 60-82C and the water/quicklime weight ratio was 6-10 at a slaking reactor detention time range of 5-50 minutes. A quicklime feed preparation system was developed and the full-scale system designed and discussed. To achieve the same pH in the treatment process, it was 1.25 times by weight of hydrated lime that quicklime was required. Treatment using slaked quicklime or hydrated lime gave the same reduction of total phosphorus, soluble phosphorus, BOD, and suspended solids, and similar sludge production rates. All quicklimes tested could be satisfactorily fed from conventional dry feeders. When quicklime was used arching/flooding from the chemical hopper was considerably lessened and lime buildup on dissolving tank side walls was reduced. (Zielinski-IPA)

EFFECT OF PRETREATMENT ON GROUNDWATER CONTAMINATION FROM LEACHING BEDS,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
M. M. Ali.
Research Publication No 83, July, 1980. 102 p, 29 Fig, 14 Tab, 20 Ref.

Descriptors: *Groundwater pollution, *Leaching, *Waste water treatment, *Effluents, *Sewers, Soil contamination, Soil columns, Water quality control, Water pollution, Groundwater movement, Groundwater, Surface-groundwater relations, Groundwater management, Leachates, Infiltration, Soil solution, Effluent streams, Effluent seepage, Soil analysis, Waste water facilities.

A simultaneous field and laboratory study was conducted at the Unionville Sewage Treatment Plant Site and at the Ministry of the Environment Applied Sciences Laboratory. In the field study, three types of effluents (septic tank (anaerobic); secondary treatment plant (aerobic); polishing lagoon (after secondary treatment)) were disposed into the ground using subsurface disposal systems to determine groundwater contamination levels and contaminant movement. In the laboratory study, the same three effluents were passed through three different sets of three identical soil columns containing soils from the three effluent disposal sites. Subsurface disposal caused groundwater quality degradation; septic tank effluent gave the highest contamination level, followed by secondary, followed by lagoon effluent. Soil column studies showed that pretreatment producing aerobic effluents has beneficial effect on contaminant removal efficiency of soil. Contaminants formed their own typical dispersion plumes in a wedge-shape spread along the groundwater direction. Subsurface movement and dispersion of contaminants varied with the hydrogeological factors and subsoil conditions. Contaminant concentrations were highest at the discharge point, decreasing gradually with increased distance from the source. (Zielinski-IPA)

ROLE OF NEMATODE-BACTERIAL INTERACTIONS IN HETEROTROPHIC SYSTEMS WITH EMPHASIS ON SEWAGE SLUDGE DECOMPOSITION,
State Univ. of New York Coll. of Environmental Science and Forestry, Syracuse. Dept. of Environmental and Forestry Biology.
B. I. Abrams, and M. J. Mitchell.
Oikos, Vol 35, No 3, p 404-410, November, 1980. 3 Fig, 2 Tab, 30 Ref.

Descriptors: *Bacteria, *Nematodes, *Sludge digestion, Biodegradation, Sewage sludge, Microbial degradation, Sludge treatment, Waste treatment, Biological treatment, Aerobic treatment, Microorganisms.

Sterilized sewage sludge was used as the substrate for two types of biological decomposition systems--bacteria, Pseudomonas fluorescens (Trevisan), the same bacteria with the nematode, Pelodera punctata (Cobb). For all trials, the bacteria-nematode systems had greater oxygen consumption, 6 times as much at 22C during a period of maximum activity. The nematodes accounted for only 5% of the total metabolism (7.14 microliters oxygen per hour per mg dry weight at 22C). Percentages of organic matter lost over 35 days at 5, 12, and 22C respectively were bacteria alone, 1.37, 2.47, and 3.51; bacteria-nematode, 2.52, 6.09, and 6.89. Nematode populations doubled in 24 days at 5C, 5 days at 11C, and 2.2 days at 22C. Nematodes stimulated bacterial activity, possibly from the grazing effect, from aeration, and from the transport of bacteria through the soil. In nematode-bacteria systems, bacterial growth was evident down to 4 cm, the depth of nematode activity; in bacterial systems, 2 cm. (Cassar-FRC)

BAYER TOWER BIOLOGY - AN EFFICIENT, LOW NOISE AND ODOR-FREE PROCESS FOR BIOLOGICAL WASTE WATER TREATMENT,
Bayer A. G., Leverkusen (Germany, F.R.) Dept. of Applied Physics.
E. Schellmann.
Progress in Water Technology, Vol 12, p 215-232, 1980. 15 Fig, 8 Ref.

Descriptors: *Biological treatment, *Operating costs, *Waste water treatment, Odor, Economics, West Germany, Biochemical oxygen demand, Aeration, Bubbles, Incineration, Adsorption, Absorption, Oxygen, Insulation.

A new plant for the biological treatment of waste water is being constructed at BAYER AG, Leverkusen, West Germany. The facility features compact closed steel tanks instead of conventional large-area basins. Very-fine bubble aeration allows 33-50% savings on the amount of oxygen needed for an equivalent amount of oxygen absorption into the waste water compared to conventional liquid heights. The height of the new tank is 30 m, and air is distributed uniformly over the whole section of the tank to provide a large interfacial area. The long residence time of the gas bubbles affords more efficient oxygen utilization, resulting in reduced energy costs for air compression and a decreased production of off-gas. The expenses for off-gas incineration are also reduced. Odor and noise pollution of the new plant are strictly controlled by novel, economical devices. HCl is adsorbed with CaO, and noise from surface aerators is reduced by insulating the air compressor station. (Geiger-FRC)

NITRIFICATION KINETICS IN A ROTATING BIOLOGICAL DISK REACTOR,
Miyazaki Univ. (Japan). Dept. of Civil Engineering.
Y. Watanabe, M. Ishiguro, and K. Nishidome.
Progress in Water Technology, Vol 12, p 233-251, 1980. 19 Fig, 2 Tab, 21 Ref.

Descriptors: *Nitrification, *Model studies, *Ammonia, *Kinetics, Temperature, Pressure, Biological treatment, Diffusion, Penetration, Permeability, Biological membranes, Mathematical studies.

A steady state kinetic model was developed to describe ammonia oxidation (nitrification) in a rotating biological disk (RBD). The model utilizes the process of molecular diffusion along with a zero-order nitrification reaction in the biofilm. The nitrification rate/unit disk area is described as the product of an overall rate constant and an equilibrium level of bulk ammonia. The overall rate constant consists of a coefficient for the transport of ammonia to the biofilm surface and a coefficient expressing this process with a simultaneous zero-order nitrification reaction within the biofilm. A bulk first-order reaction proceeds at very low ammonia concentrations due to the rate limiting process of ammonia transport to the biofilm surface. Half-order and zero-order kinetics occur as bulk ammonia levels increase with respect to ammonia levels in the biofilm surface. These processes are affected by the penetrability of oxygen and ammonia into the biofilm. When the penetration thickness of oxygen is greater than that of ammonia, a half-order reaction takes place. A zero-order reaction occurs when the ammonia penetrability exceeds that of oxygen. At ammonia equilibrium levels, the transition from half- to zero-order kinet-

ics may take place depending upon the operating conditions. The model was applied to two completely-mixed flow reactors in a series of nitrification experiments. Results were in good agreement with model predictions when temperature, disk rotation velocity, partial pressure of oxygen in the gaseous phase, hydraulic loading and influent ammonia levels were varied. PRACTICAL PROBLEMS RELATED TO NITROGEN BUBBLE FORMATION IN FIXED FILM REACTORS,
Technical Univ. of Denmark, Lyngby. Dept. of Sanitary Engineering.
P. Harremoes, J. C. Jansen, and G. H. Kristensen.
Progress in Water Technology, Vol 12, p 253-269, 1980. 10 Fig, 2 Tab, 16 Ref.

Descriptors: *Bubbles, *Denitrification, *Nitrogen, *Filters, Biological membranes, Biological treatment, Aeration, Pilot plants, Kinetics, *Waste water treatment, Mathematical studies, Model studies.

A pilot plant study has shown that during the denitrification of a nitrified effluent in a down-flow filter, nitrogen supersaturation and bubble formation take place and affect the performance of the reactor. Methanol provided the carbon and energy source, and the media size was 2-4 millimeters. A nitrogen build-up produced inside the biofilm was attributed to the diffusional resistance. Supersaturation always occurs in the biofilm before it takes place in the bulk water. An overall removal of 4 milligrams/liter NO3-N will lead to bubble formation in the bulk liquid which will disappear in rotating discs, coarse media filters and fluidized beds. In fine media filters, the bubbles may be trapped, giving rise to increased head loss and reduced removal rates. When a concentration of 6 milligrams NO3-N or greater is present in the bulk liquid, nitrogen content in the biofilm may exceed the saturation point, causing bubble formation between the biofilm and support media and detachment of the biofilm from the surface. When the turbulent shear is high, the biofilm will be sloughed off, and the resulting empty spaces will cause reduced overall performance. If the turbulent shear is low, the biofilm will be only partially detached, allowing it to flutter in the stream. When this occurs, it will be able to contribute more biofilm area on a continuous basis, which will improve performance per unit surface of the reactor. (Geiger-FRC)

DESIGN OF FIXED-FILM PROCESSES WITH STEADY-STATE-BIOFILM MODEL,
Stanford Univ., CA. Dept. of Civil Engineering.
B. E. Rittmann, and P. L. McCarty.
Progress in Water Technology, Vol 12, p 271-281, 1980. 4 Fig, 2 Tab, 26 Ref.

Descriptors: *Kinetics, *Model studies, *Biological treatment, Groundwater recharge, Pilot plants, Mathematical models, Denitrification, *Waste water treatment, Biological membranes, Chemical oxygen demand, Filters, Design criteria, Methane, Oxidation, Nitrification.

A previously described, fundamental model of biofilm kinetics has been used to predict biofilm performance, including the existence of a minimum substrate concentration. The single model was applied to full-scale systems treating different waste waters by various aerobic and anaerobic processes. The model was accurate in predicting the performance of larger fixed-film processes for denitrification, methanogenesis, and aerobic oxidation. The biofilm model was successful in predicting the steady-state removal of COD during groundwater recharge experiments. The model is based on independently obtained parameters of bacterial kinetics and mass transport for a steady-state biofilm, and the reactor configurations are fluidized and fixed-bed filters and a rotating disc. The model requires no fitting factors, and may be useful in recommending processes or in predicting when other processes will be inadequate for meeting design requirements. The model may also be applied as an aid in designing pilot and full-scale treatment facilities. (Geiger-FRC)

A GENERAL EQUILIBRIUM MODEL FOR THE PRECIPITATION OF PHOSPHATE WITH IRON AND ALUMINIUM,
Technical Univ. of Denmark, Lyngby. Dept. of Sanitary Engineering.
E. Arvin, and G. Peterson.
Progress in Water Technology, Vol 12, p 283-298, 1980. 4 Fig, 4 Tab, 13 Ref.

Descriptors: *Model studies, *Phosphates, *Chemical precipitation, Iron, Aluminum, Hydrogen ion concentration, Mathematical studies, Bicarbonates, Calcium, *Waste water treatment, Nutrients, Solubility, Separation techniques.

An equilibrium model was developed which closely simulated the experimental data from a number of batch and continuous, simultaneous- and post-precipitation systems for phosphate removal. The model is based on the assumption that all or part of the phosphate is precipitated as a complex containing calcium, iron (or aluminum), phosphate, and carbonate. A minimum solubility was observed in all of the experimental systems tested, which included a simultaneous precipitation pilot plant with addition of ferrous sulfate, a full scale post-precipitation plant using aluminum sulfate, and laboratory batch systems with sludge from pilot or full scale plants or synthetic waste water. Optimum pH values ranged from 6.6 to 8.8, depending on the dosage of the chemicals. Phosphate solubility may be reduced by increasing the calcium activity and decreasing the bicarbonate activity. The effects of calcium and bicarbonate may not be the same in simultaneous- and post-precipitation systems with iron additions; the effect of bicarbonate was significant only when the level of oxygen was decreased to near zero saturation. NON-BIOLOGICAL ELIMINATION MECHANISMS IN A BIOLOGICAL SEWAGE TREATMENT PLANT,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
C. Matter-Muller, W. Gujer, W. Giger, and W. Stumm.
Progress in Water Technology, Vol 12, p 299-314, 1980. 5 Fig, 5 Tab, 20 Ref.

Descriptors: *Volatility, *Absorption, *Activated sludge, Biomass, *Waste water treatment, Organic wastes, Organic compounds, Municipal wastes, Biodegradation, Aromatic compounds, Biological treatment, Water pollution treatment, Pollutants.

Volatile organic pollutants that are non-biodegradable may be effectively removed from waste water by treatment in an activated sludge process. These substances are either absorbed into the sludge biomass or are volatilized with the oxygen transfer to the mixed liquor. The degree of absorption into the sludge biomass may be predicted from the lipophilicity of the substances, which is determined by their n-octanol-water distribution coefficients and is designated by a distribution equilibrium between the solids and the liquid. The volatilization of less lipophilic compounds can be associated with the mass transfer coefficient of oxygen and may be calculated from the critical volume of these substances. The validity of these two removal processes was investigated in two semi-technical activated sludge procedures operated in parallel by estimating a mass balance for four indicator compounds. The compounds used, n-heptadecane, Pristane PR, 1,2,4-trimethylbenzene, and p-dichlorobenzene, are indigenously present in the municipal wastes of Zurich. These compounds were removed with efficiency. Absorption of these pollutants into the biomass and volatilization are also important factors in evaluating the fate and residence time of refractory organics in natural water systems. (Geiger-FRC)

OPTIMAL ADVANCED TREATMENT AND PHOSPHOROUS REMOVAL BY DEEP BED FILTRATION,
Sulzer Brothers, Ltd., Winterthur (Switzerland). Water and Waste Water Treatment.
H. Gros, and B. Morgeli.
Progress in Water Technology, Vol 12, p 315-332, 1980. 11 Fig, 13 Ref.

Descriptors: *Filtration, *Phosphorus, *Flocculation, *Waste water treatment, Filters, Pilot plants, Switzerland, Separation techniques, Pressure, Flow rates, Municipal wastes, Industrial wastes, Design data.

An advanced waste water treatment system has been adopted by many Swiss cities for the removal of phosphorus. The new flocculation-filtration system was tested at a medium sized pilot plant with the aid of computer controlled operations. It was shown that very low phosphorus residues were permitted with the filtration process, and substantial savings were achieved in the second stage of phosphorus elimination. Pilot studies at the Aadorf waste water treatment plant were conducted to calculate the optimal bed height and filter media. The combined effects of pressure drop and flow velocity on the performance of the system were examined. The effects of long-term operating and backwashing on phosphorus removal efficiency were also evaluated. Comparisons of surface versus deep bed filtration are given. The new deep-bed filter system allows optimal operation at various filtration rates and high flocculant addition rates, which may result in reductions of the total amount of iron used for the different stages of phosphorus elimination. A COMPARATIVE STUDY OF VARIOUS COAGULANTS FOR THE RENOVATION OF SECONDARY EFFLUENTS,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. van Vuuren, G. G. Cillie, J. van Leeuwen, and J. Prinsloo.
Progress in Water Technology, Vol 12, p 333-346, 1980. 9 Fig, 6 Tab, 7 Ref.

Descriptors: *Coagulation, *Reclaimed water, *Waste water treatment, Sludge treatment, Lime, Calcium carbonate, Water quality, Phosphorus, Iron compounds, Chlorination, Comparative costs, Water purification, Impaired water use, Water reuse, Water treatment.

Various compounds were evaluated as alternative coagulants for the renovation of activated sludge effluent in a 4,500 cu meter/day water reclamation facility. Adequate clarification and phosphorus removal were achieved with ferric chloride, aluminum sulfate and lime, with slightly better results when the last of these three was used. Lime treatment provided softening and good microbial control without interstage chlorination. During ferric chloride or aluminum sulfate clarification, interstage chlorination was required. High lime coagulation was the most expensive process, due to the high costs of sludge handling, maintenance and capital costs. Ferric chloride coagulation was the least expensive in terms of water reclamation costs. All three methods yielded reclaimed water of excellent chemical and microbial quality after further processing by breakpoint chlorination, sand filtration, ozonation, active carbon treatment, final chlorination and stabilization. The reuse application usually determines the choice of coagulant. Effluent quality and constant quality in terms of ammonia levels are important parameters in figuring water reclamation costs. (Geiger-FRC)

LIME TREATMENT OF WASTE WATER: DEVELOPMENT AND APPLICATION OF A SIMPLE GRAPHICAL TECHNIQUE FOR PREDICTING THE CHEMICAL COMPOSITION OF LIME-TREATED SECONDARY EFFLUENT,
National Inst. for Water Research, Pretoria (South Africa).
H. N. S. Wiechers, R. E. Loewenthal, and G. van

R. Marais.
Progress in Water Technology, Vol 12, p 347-358, 1980. 5 Fig, 1 Tab, 14 Ref.

Descriptors: *Waste water treatment, *Lime, *Model studies, Sewage treatment, Magnesium hydroxide, Calcium carbonate, Pilot plants, Alkalinity, Hydrogen ion concentration, Mathematical models, Water purification, Sludge, Phosphates.

The Modified Caldwell-Lawrence Diagram, a simple graphical model of the calcium-carbonate-magnesium system, was utilized to predict the chemical composition of stabilized lime-treated secondary effluent. The modified model utilized appropriate CaCO3 and Mg(OH)2 activity product constants instead of thermodynamic solubility product constants to predict: treated effluent pH; residual calcium, magnesium and total alkalinity; and the amount of lime needed to attain a specified effluent composition and to generate an associated mass of sludge. The model was applied to predicting the chemical composition of lime-treated secondary effluents at the Stander Water Reclamation plant, Pretoria, South Africa, and the Lebanon pilot plant, Ohio. Model results agreed closely with the experimental values, even though the effluents of the plants were of widely different composition and were treated under different reaction conditions. The present model should be of use to design engineers and plant operators in planning and using lime treatment systems. (Geiger-FRC)

KINETICS OF BIOLOGICAL FLUIDIZED BED WASTE WATER DENITRIFICATION,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Center.
J. P. Stephenson, and K. L. Murphy.
Progress in Water Technology, Vol 12, p 159-171, 1980. 8 Fig, 6 Tab, 23 Ref.

Descriptors: *Kinetics, *Denitrification, Pilot plants, Municipal wastes, Nitrate, Nitrite, Model studies, Mathematical models, Temperature, Nitrogen, Biological treatment, *Waste water treatment.

Pilot scale tests were conducted to describe the kinetic performance of a biological fluidized bed reactor for the denitrification of municipal waste waters. To describe the denitrification process, a half-order kinetic model (8 to 48 milligrams/liter nitrate plus nitrite nitrogen) coupled with an Arrhenius temperature dependence relationship (4 to 27 degrees) was used. The rate of denitrification was affected very little by the hydraulic flux (0.25 to 1.7 cu meters/sq meter/minute) or the biofilm support media of granular activated carbon and sand. The fluidized bed process gave the same nitrate plus nitrite nitrogen removal under similar effluent waste water conditions and at volumetric denitrification rates about ten times faster than suspended growth or submerged rotating biological contactor methods. The temperature dependence of the removal rate was equivalent to that found in a packed column, but less than that of suspended growth or submerged rotating biological contactor techniques. (Geiger-FRC)

INDUSTRIAL WASTE CARBON SOURCES FOR BIOLOGICAL DENITRIFICATION,
Ontario Research Foundation, Mississauga.
J. D. Monteith, T. R. Bridle, and P. M. Sutton.
Progress in Water Technology, Vol 12, p 127-141, 1980. 7 Fig, 3 Tab, 15 Ref.

Descriptors: *Industrial wastes, *Denitrification, Biological treatment, *Waste water treatment, Cost analysis, Carbon, Nitrate, Nitrite, Economics, Waste treatment, Oil wastes.

Several industrial wastes or waste by-products were examined for their ability to replace methanol as the carbon source in biological denitrification treatment processes. This project, conducted by the Waste Water Technology Center, Burlington, Ontario, was aimed at reducing the costs of biological denitrification due to the increasing costs of methanol. After bench scale testing, thirty characterized waste waters were examined for batch denitrification rates. Twenty-seven of these showed rates of denitrification greater than or equal to that of methanol. The greatest denitrification rate occurred with a distillery fusel oil, and many of the wastes yielded substrate consumption rates equal to or less than that of methanol. A correlation was found between the initial FOC:N ratio and the substrate consumption ratio. Cost analyses showed that the use of industrial wastes in place of methanol as a carbon source in the denitrification process was very economical. (Geiger-FRC)

KINETIC MODEL OF BIOLOGICAL DENITRIFICATION IN A FLUIDIZED BED BIOFILM REACTOR (FBBR),
Westvaco Corp., NC. Charleston Research Center.
L. T. Mulcahy, W. K. Shieh, and E. J. LaMotta.
Progress in Water Technology, Vol 12, p 143-157, 1980. 5 Fig, 13 Ref.

Descriptors: *Model studies, *Denitrification, *Kinetics, Biological treatment, Mathematical studies, Nitrate, Nitrite, Diffusion, Equations, *Waste water treatment, Nitrogen.

A kinetic model was designed to describe the process of biological denitrification in a fluidized bed biofilm reactor (FBBR). An analysis of intrabiofilm diffusion and simultaneous zero order reaction is used to generate an effectiveness factor expression for individual biofilm covered particles in the FBBR. This individual particle cover is related to a one-dimensional reactor plug flow equation to give an overall kinetic model for convective transport along with biochemical conversion of nitrate in the heterogeneous reactor. To relate the biochemical conversion rate to the intrabiofilm diffusion rate, a modified Thiele modulus is proposed. For a Thiele modulus greater than 1.15, the FBBR is limited by diffusion, while 0.45 order kinetics are observed. When the Thiele modulus is less than 1.15, diffusion limiting factors are negligible and intrinsic zero order kinetics are found. When nitrate profiles from laboratory scale FBBR under various conditions of operation were compared to those predicted by the kinetic model, good agreement was found. (Geiger-FRC)

BIOLOGICAL NITROGEN REMOVAL BY STEP-FEED PROCESS,
Kurita Central Labs., Yokohama (Japan).
Y. Miyaji, M. Iwasaki, and Y. Sekigawa.
Progress in Water Technology, Vol 12, p 193-202, 1980. 10 Fig, 5 Tab, 5 Ref.

Descriptors: Theoretical analysis, *Denitrification, *Operating costs, Model studies, Biological treatment, Nitrification, Recycling, *Waste water treatment, Municipal wastes, Nitrogen, Recirculated water, Mathematical studies, Nitrate, Nitrite.

A new multi-stage, step-feed process was tested to reduce the operational costs of biological nitrogen removal by cutting consumption of chemicals and reducing power requirements. The new process employs denitrification and nitrification compartments which are arranged in a series into which waste water is fed and equally divided. Equations are presented and compared for the efficiency of nitrogen removal in the conventional one-stage step-feed system. Evaluation of the theoretical expressions shows that the recycling ratio can be greatly reduced in the new process, resulting in decreases in power costs. More than 90% removal of nitrogen was achieved in a night-soil treatment plant using the step-feed process without sodium hydroxide or methanol. The theoretical calculations of the new system proved valid when the method was applied to real operating conditions. The step-feed method may also be used in the treatment of municipal waste water where the power costs are strongly dependent on the amount of recirculation. (Geiger-FRC)

WASTE WATER TREATMENT PLANT FEATURES PUMPING FLEXIBILITY,
Superintendent of Water Pollution Control Plant and Sewer Lines.
G. Elbert, and M. L. Thornton.
Public Works, Vol 112, No 2, p 70-71, February, 1981.

Descriptors: *Waste water treatment, *Treatment facilities, *Pumps, Submersible pumps, Activated sludge, Indianola, Iowa.

A new waste water treatment plant at Indianola, Iowa, began operation in August 1979. It is unique in its use of submersible pumps to handle almost the entire process flow. Primary treatment facilities include two clarifiers and grit removal. Secondary treatment uses the activated biofilter process followed by short-term aeration and final clarification. Final clarifier effluent is pumped through mixed media filters. After chlorination, effluent is discharged to the Middle River. The plant contains a total of 28 submersible pumps which can be raised or lowered as necessary. Construction of dry wells was eliminated. The pumps are distributed as follows: headworks, four 35 hp and three 77 hp; prior to activated sludge biofilter, four 20 hp; secondary treatment, four 20 hp and one 77 hp for filter backwashing; sludge pumping, two 32 hp, two 2 hp, two 9.4 hp, and six variable speed. MERCURY(II) SORPTION BY WASTE RUBBER,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
W. R. Knocke, and L. H. Hemphill.
Water Research, Vol 15, No 2, p 275-282, February, 1981. 7 Fig, 3 Tab, 13 Ref.

Descriptors: *Absorption, *Mercury, *Synthetic rubber, Sorption, Water pollution, Kinetics, Waste water treatment, Hydrogen ion concentration, Temperatures, Particle size, Diffusion, Water pollution treatment, Sulfur compounds, Metals, Rubber, Vulcanized tire rubber.

Preliminary investigations on the removal of mercury from aquatic systems have shown rubber tire material to be a good absorbent of inorganic mercury in aqueous solutions. The kinetics of this sorption process were examined in batch tests using ground samples of vulcanized tire rubber. Parameters investigated included aqueous mercury levels, rubber sorbent particle size, pH and temperature of the reaction solution. To aid in identifying the mechanisms of mercury absorption, some sulfur-free rubber materials were also studied. Tire rubber proved to be an efficient remover of mercury from waste solutions. pH was the most influential of the parameters on the rate of mercury removal. For good removal of mercury, a pH range of 5.5-6.0 was recommended. The rate limiting step of mercury uptake was found to be the diffusion of mercury through the pores in the rubber sorbent. Sulfur-free rubbers were also effective in removing inorganic mercury from aqueous solutions. (Geiger-FRC)

ANAEROBIC TREATMENT KINETICS OF PALM OIL SLUDGE,
Singapore Univ. Dept. of Civil Engineering.
K. K. Chin.
Water Research, Vol 15, No 2, p 199-202, February, 1981. 4 Tab, 15 Ref.

Descriptors: *Sludge digestion, *Anaerobic digestion, *Oil wastes, Sludge treatment, Kinetics, Fermentation, Laboratory tests, Suspended solids, Waste water treatment, Operating costs, Recycling, Waste treatment, Biochemical oxygen demand, Chemical oxygen demand.

A completely-mixed, suspended growth continuous anaerobic fermentation system was evaluated in laboratory scale tests for the treatment of palm oil sludge. Tests were carried out in 20 liter PVC digesters, and progress of the treatment was monitored by daily measurements of gas production and composition. Biochemical oxygen demand, chemical oxygen demand (COD), alkalinity, volatile acids, volatile solids, pH and nitrogen were also measured at regular intervals. Biokinetic coefficients were calculated for systems with and without solids recycle. For units with solids retention times greater than 25 days, gas production rates averaged 0.9 liters/gram BOD, COD, and volatile suspended solids. The rates of gas production averaged about 0.9 liters/gram BOD used, with an energy yield of 20,000 J/g BOD utilized for units with solids retention times over 25 days. The minimum solids retention time was estimated to be greater than 10 days. However, the measured minimum solids retention time was actually less than 7 days. Other factors necessary for process stability are considered, along with operating costs and some possible energy saving modifications. (Geiger-FRC)

ANAEROBIC TREATMENT OF WASTES CONTAINING METHANOL AND HIGHER ALCOHOLS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Water Pollution Control.
G. Lettinga, W. de Zeeuw, and E. Ouborg.
Water Research, Vol 15, No 2, p 171-182, February, 1981. 6 Fig, 5 Tab, 21 Ref.

Descriptors: *Fermentation, *Alcohols, *Anaerobic digestion, *Sludge digestion, Microbial degradation, Chemical oxygen demand, Sewage sludge, Waste water treatment, Biological treatment, Methane, Trace elements, Anaerobic bacteria, Volatility, Carbohydrates, Biodegradation.

Continuous and batch experiments were carried out to evaluate the anaerobic digestion of a fusel oil containing about 50% methanol and 50% higher alcohols. The 'Upflow Anaerobic Sludge Blanket' (UASB) process was used in the continuous experiments. This process employed a sugar beet waste-grown anaerobic (SBA) sludge as inoculum. The SBA sludge was highly settleable and superior to digested sewage sludge as seed material for the treatment process. The breakdown of higher alcohols starts immediately, and that of methanol, a few days later. Using the UASB system, a space sludge load of up to 20 kilograms chemical oxygen demand/cubic meter/day could be handled within the first week. Contrary to previous studies in the literature, the sludge is able to ferment volatile fatty acids (VFA) and methanol rapidly and simultaneously under favorable conditions. The presence of the right trace elements is important to the stability of the process. At present, the operation of a fail-proof anaerobic process for the treatment of methanolic wastes cannot be guaranteed. (Geiger-FRC)

SUBMERGED COMBUSTION FOR SLUDGE DIGESTION,
Water Services, Vol 84, No 1018, p 718-719, December, 1980.

Descriptors: *Submerged combustion, *Anaerobic digestion, *Sludge digestion, Sewage treatment, *Waste water treatment, Activated sludge, Digestion, Industrial wastes, Municipal wastes.

A 200,000 BTU submerged combustion unit for sludge digestion was installed at the Welshpool Sewage Treatment Works in November, 1978. Results to date indicate that digestion time was reduced to 12-15 days from 91 days for the customary cold retention time. The anaerobic digester is 15 m x 4.6 m x 2.7 m deep. It is maintained at 35C by burning natural gas at about 5.3 cu m per hour. Submerged combustion burners use a submerged flame burning below the liquid surface. This is very efficient (97% at 35C and 88% at 60C) and operates on any gas or liquid fuel having a calorific value greater than 150 BTU per cu foot. Applications for submerged combustion equipment are separation and neutralization of waste liquors, accelerated sludge digestion, killing pathogens, and recarbonation of alkaline industrial and municipal wastes. RENOVATION OF WASTE WATER BY SOIL COLUMNS FLOODED WITH PRIMARY EFFLUENT,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
J. C. Lance, R. C. Rice, and R. G. Gilbert.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 381-388, February, 1980. 5 Fig, 2 Tab, 13 Ref.

Descriptors: *Waste water treatment, *Groundwater recharge, *Infiltration rates, Land disposal, Ultimate disposal, Vegetation effects, Nitrogen compounds, Phosphorus compounds, Phosphates, Organic compounds, Coliforms, Viruses, Disposal, Induced infiltration, *Water reuse.

The rapid infiltration method was used to flood soil columns (2.75 meters long and 15 cm diameter) with primary effluent to test the feasibility of this energy-saving method, which has been used successfully to remove pollutants from secondary effluent. The good removal rates obtained in laboratory studies show that the high-rate land filtration method may be used to treat primary effluent directly and eliminate secondary effluent treatment. Nitrogen removal was 45.6 and 81.8% for non-vegetated and vegetated columns, respectively. Phosphate-phosphorus levels ranged from 66 to 72% after a wave of phosphate was leached from the columns. This phosphate release was probably caused by the phosphate retained on the columns during previous experiments. Most of the organic carbon was removed - influent concentration, 75 mg per liter, and effluent, 6.9 mg per liter. Fecal coliforms concentration in the influent was 0.65 million to 20 million per 100 ml water. Soil adsorption removed all but 0 to 186 per 100 ml water. Coliform removal was the same on vegetated and non-vegetated columns. Poliovirus at a level of 12,000 plaque forming units per ml was totally absorbed in 80 cm. During 34 weeks of intermittent flooding, infiltration rates in soil columns exposed to the atmosphere declined by only 3%. During the second 34 weeks, infiltration dropped by 30%, indicating a need for cultivation. Infiltration rates were the same for vegetated and non-vegetated columns. Soil not exposed to sunlight had 50% reduced infiltration rates in 4 months of intermittent flooding. (Cassar-FRC)

THE ROLE OF ADSORPTION IN BIOLOGICALLY EXTENDED ACTIVATED CARBON COLUMNS,
Maine Univ., Orono.
J. D. Lowry, and C. E. Burkhead.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 389-398, February, 1980. 9 Fig, 4 Tab, 9 Ref.

Descriptors: *Activated carbon, *Adsorption, *Waste water treatment, Biodegradation, Sand, Coal, Organic compounds.

Activated carbon did not promote biological activity to a greater extent than sand and coal on water treatment adsorption columns. Activated carbon is more expensive, less durable, and much harder to backwash than sand. Data indicated that adsorption was not a factor in increased biological removal; in fact, the microorganisms on the surface impeded adsorption and caused a large pressure loss on the column. The author stated that the vast internal pore structure of activated carbon is unavailable to the large microorganisms, and therefore the activated carbon behaves no differently than a relatively inert medium. EVALUATION OF EXTENDED AERATION ACTIVATED SLUDGE PACKAGE PLANTS,
WTC, Burlington (Ontario).
P. H. M. Guo, D. Thirumurthi, and B. E. Jank.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 33-42, January, 1981. 4 Fig, 8 Tab, 6 Ref.

Descriptors: *Package plants, *Activated sludge, *Performance, *Costs, *Waste water treatment, Operation and maintenance, National Sanitation Foundation, Aeration, On-site tests, Ice, Suspended solids, Biological oxygen demand, Evaluation, Quality control, Effluent.

Performance of 20 package waste water treatment plants produced by 6 different manufacturers was evaluated during May-October 1976 by the National Sanitation Foundation. Plants ranged in size from 8 to 454 cu m per day, and they all treated domestic wastes exclusively by the extended aeration activated sludge process. Only 4 of the plants produced effluent of satisfactory quality. Median BOD5 ranged from 37 to 290 mg per liter; suspended solids, 13 to 156 mg per liter. The major cause of poor performance was operator-related: insufficient manpower or lack of training. Other process and equipment problems were insufficient biomass, improper aeration, floating sludge, offensive odors, lack of sludge treatment facilities, mechanical breakdown of comminutors, clogging of air diffusers and sludge return systems, malfunction of the skimming device, and ice formation in the clarifiers. Design capacity and equipment cost were correlated. Using the equation provided, a 100 cu m per day plant would cost $45,000 as of 1977. Operating and maintenance costs for the 20 plants in 1975 ranged from $410 for a plant designed for 49 cu m per day and operating at 8 cu m per day to $4,840 for a 454 cu m per day plant operating at 173 cu m per day. MIXING EFFICIENCIES IN FULL-SCALE AEROBIC DIGESTERS BY TRACER METHODS,
Canviro Ltd., Waterloo (Ontario).
H. D. Monteith, and J. P. Stephenson.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 78-84, January, 1981. 6 Fig, 16 R

Descriptors: *Mixing, *Anaerobic digestion, *Tracers, Digestion, Efficiencies, Sodium fluoride, *Waste water treatment.

Mixing patterns in two digester systems were studied with a sodium fluoride tracer. In the prim

digestion tanks, up to 77% of the volume was a dead zone with respect to active mixing. In another case, shortcircuiting allowed 61% of the throughput of the primary digester to avoid treatment. Transferring sludge from primary to secondary digester concurrent with sludge dewatering caused nearly 100% shortcircuiting. Inadequate mixing leads to many problems: incomplete stabilization of raw sludge, reduced energy recovery by methane gas production, reduced pathogenic organism destruction, and system overdesign. (Cassar-FRC)

ANAEROBIC DIGESTION OF BREWERY BY-PRODUCTS,
Pennsylvania Univ., PA. Dept. of Civil and Urban Engineering.
J. D. Keenan, and I. Kormi.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 66-77, January, 1981. 6 Fig, 8 Tab, 29 Ref.

Descriptors: *Brewery industry, *Anaerobic digestion, *Methane, Industrial wastes, *Waste water treatment, Gases, Digestion, Fermentation, Organic matter, Energy, Costs.

Mesophilic anaerobic fermentation reduced organic loading of brewery waste water and produced methane gas during laboratory tests with three 14 liter vessels. Most favorable conditions for digestion were 10 days retention time and a loading rate of 6 grams substrate per liter per day. At rates greater than this, digester failure occurred. Methane gas production was 0.33 liters at a loading rate of 2 g per liter per day and 0.30 liters at 6 g per liter per day. Gas production increased with detention time: 8 to 15 days, 0.32 to 0.41 liters per g dry substrate respectively. Cost estimates showed that a 1000 cu ft digestion plant could produce methane at a cost of $1.19 per million BTU. This represents 34% of the natural gas requirements of a brewery or 17% of total energy requirements. (Cassar-FRC)

VACUUM WASTE WATER COLLECTION: THE ALTERNATIVE SELECTED IN QUEEN ANNE'S COUNTY, MARYLAND,
O'Brien and Gere Engineers, Inc., Dover, DE.
A. F. Hassett, and J. C. Starnes.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 59-65, January, 1981. 2 Tab, 7 Ref.

Descriptors: *Queen Anne's County, Maryland, *Vacuum sewers, *Waste water, *Sewerage, Design criteria, Costs, Capital costs, Operating costs, Maintenance costs, *Waste water treatment.

Queen Anne's County, Maryland, has chosen the vacuum waste water collection system to serve a 5,000 population in a 766 hectare area of low-lying land interlaced with tidal creeks and bays. There are 1,800 residences and commercial establishments, including restaurants, marinas, and seafood processing plants. Present disposal is by on-site systems, most of which are malfunctioning. Vacuum sewers collect waste by maintaining negative pressure at central collection stations. When waste water from individual service has reached a given level in the holding tank, a pressure sensor opens a valve, allowing the material to be exhausted into the sewer line. The reintroduction of atmospheric air again closes the valve. Capital costs for several alternative systems are as follows: vacuum, $8.1 million; pressure, $10.4 million; and gravity, $15.5 million. Annual operating and maintenance costs are $893,000, $1.117 million, and $1.737 million respectively. Design criteria include an air to liquid ratio of 2:1, pressure differential of 5.6 meters, minimum pipe slope of 0.25%, one vacuum valve for every 2 residential units, waste water introduced in 10 gallon slugs, design peak flow 0.031 liters per second for each residential unit, 61,000 meters of sewers, and 1,050 vacuum valves. Difficulties in earlier systems are recognized and should be eliminated from this proposed system. (Cassar-FRC)

TESTING AERATION EQUIPMENT IN CONVENTIONAL ACTIVATED SLUDGE PLANTS,
Kansas Univ., Lawrence. Dept. of Environmental Engineering.
R. E. McKinney.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 48-58, January, 1981. 10 Fig, 10 Tab, 15 Ref.

Descriptors: *Activated sludge, *Aeration, *Oxygen demand, *Mixing, Operation, *Waste water treatment, Aerobic treatment, Dissolved oxygen, Milwaukee, Denver, Detroit, Memphis.

Evaluation of aeration in conventional activated sludge plants in 4 cities showed that measurement of oxygen uptake rate and dissolved oxygen at regular intervals along the length of the tank from influent to effluent end gave data useful in evaluating actual oxygen transfer. All tanks studied, from single-pass to ten-pass, showed the same rapid mixing pattern. The oxygen uptake rate dropped rapidly during the first third of the length of the tank, to a point of relatively constant decrease, at which the rate of decrease was controlled by the rate of oxygen transfer under oxygen limiting conditions. The change in oxygen uptake after the initial drop was used to evaluate the oxygen transfer rate. In aeration tanks where aerobic conditions were reached, the oxygen uptake rate at the point where the system became completely aerobic was used to check the value obtained under oxygen limiting conditions. FAULT TREE ANALYSIS AND TREATMENT PLANT INSTRUMENTATION,
Tennessee Valley Authority, Muscle Shoals, AL.
D. L. Kelley, and R. C. Allison.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 43-47, January, 1981. 3 Fig, 1 Tab, 3 Ref.

Descriptors: *Instrumentation, *Monitoring, *Fault tree analysis, Analysis, *Waste water treatment, Control systems.

A monitoring system was designed for a small waste water treatment plant serving a town of 3000 people. The technique used was fault tree analysis, a concise and orderly description of the various occurrences within a system that can result in an undesirable event, such as failure of one of the treatment processes. The fault tree analysis of the chlorination process is shown in detail. Possible types of failure were pinpointed: primary, loss of chlorine gas flow; and secondary, insufficient chlorine gas flow--with consequences of each. Tertiary failures were those occurring outside the system, but affecting operations, e.g., cold temperatures. Using this analysis, sensors were easily assigned to desired points in the process. An input-output flow of the entire monitoring system shows 16 sensor points measuring levels, flows, turbidity, and pressure. (Cassar-FRC)

NITRIFICATION IN ROTATING BIOLOGICAL CONTACTORS,
Manhattan Coll. Bronx, NY. Environmental Engineering and Science Program.
J. A. Mueller, P. Paquin, and J. Famularo.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 688-710, April, 1980. 21 Fig, 9 Tab, 15 Ref.

Descriptors: *Mathematical models, *Nitrification, *Design, Temperature, Kinetics, *Waste water treatment, Biochemical oxygen demand, Calibrations, Mass transfer, Rotating biological contactors.

A model of rotating biological contactors (RBC) was developed, calibrated, and verified. The model is applicable to soluble organic carbon (BOD or COD) removal, nitrification, and soluble nitrogen removal. Material balance equations are numerically integrated to yield concentrations of the carbonaceous and nitrogenous substrates in the liquid film and biofilm attached to the rotating media, as well as concentrations in the mixed tank and effluent liquid from each stage. The model is successful because it incorporates the basic principles of mass transfer and simultaneous reaction in a steady-state mathematical model. The kinetic rate constants used to describe the performance of the Gladstone, Michigan plant were related by a temperature factor of 1.1. The model was tested for six different operating conditions for Gladstone, but further testing is recommended with waste waters of different character. The model allows the designer to describe process performance with a single set of temperature-corrected kinetic coefficients for a particular waste. (Small-FRC)

MECHANISM UNDERLYING THE REMOVAL OF ORGANIC MICROPOLLUTANTS DURING FLOCCULATION BY AN ALUMINUM OR IRON SALT,
Societe Lyonnaise des Eaux et de l'Eclairage (France).
P. Thebault, J. M. Cases, and F. Fiessinger.
Water Research, Vol 15, No 2, p 183-189, February, 1981. 7 Fig, 3 Tab, 19 Ref.

Descriptors: *Coagulation, *Organic wastes, Water pollution, Separation techniques, Adsorption, Flocculation, Pesticides, Lindane, *Waste water treatment, Minerals, Tertiary treatment, Organic compounds, Potable water.

The removal of micropollutants from waste waters during the coagulation step of treatment would provide a cost effective method for handling harmful organics. The possibility of using basic aluminum polychloride and ferric chloride for the removal of lindane, benzopyrene, diethylphthalate and dibutylphthalate was investigated in laboratory tests. Water samples taken from the western Paris distribution system and free of mineral colloids were spiked with known amounts of the micropollutant before coagulation-flocculation in an FLH6 Hydrocure flocculator. Generally, the reduction of the micropollutants was poor, except for benzopyrene, with a 62% reduction on both mineral coagulants. For lindane and benzopyrene, the adsorption isotherms were found to obey Henry's law. For diethyl- and dibutylphthalates, the adsorption was attributed to a first order phase change in the adsorbed layer due to the influence of lateral bonds. The efficiency of the removal should be improved by controlling the formation of Al or Fe coagulant species which would favor adsorption. (Geiger-FRC)

5E. Ultimate Disposal Of Wastes

SELECTED HYDROLOGIC DATA FROM THE VICINITY OF RAYBURNS AND VACHERIE SALT DOMES, NORTHERN LOUISIANA SALT-DOME BASIN,
Geological Survey, Baton Rouge, LA. Water Resources Div.
G. N. Ryals, and R. L. Hosman.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $2.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-217, July, 1980. 17 p, 3 Fig, 7 Tab, 5 Ref, 2 Plates.

Descriptors: *Hydrologic data, *Nuclear wastes, *Underground waste disposal, *Radioactive waste disposal, *Louisiana, Water quality, Hydrogeology, Groundwater movement, Surface-groundwater relationships, Water analysis, Radiochemical analysis, Hydrographs, Northern Louisiana salt-dome basin, Rayburns salt dome(LA), Vacherie salt dome(LA).

The U.S. Department of Energy is considering salt domes in northern Louisiana as possible sites for storage of nuclear waste. As part of this National Waste Terminal Storage (NWTS) Program, the U.S. Geological Survey is conducting a regional study of the geohydrology of the northern Louisiana salt-dome basin. Field studies involving the collection of data began in 1977. Data-collection networks were established for both ground- and surface- water sources, primarily in the vicinity of

two salt domes, Rayburns and Vacherie. Groundwater data collection involved measuring water levels and sampling existing production wells and test wells drilled by the Louisiana State University for Environmental Studies. Samples were analyzed for one or more of the following categories of chemical constituents: inorganic, trace metal, and radiochemical. A network of surface-water stations was set up for measuring discharge and collecting periodic samples. Initial sampling was for analysis for inorganic chemical constituents and radioactive elements. Subsequent sampling has been for inorganic chemical constituents. (USGS)

GEOHYDROLOGY OF THE KEECHI, MOUNT SYLVAN, OAKWOOD, AND PALESTINE SALT DOMES IN THE NORTHEAST TEXAS SALT-DOME BASIN,
Geological Survey, Austin, TX. Water Resources Div.
J. E. Carr, S. J. Halasz, and H. B. Peters.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $12.00 in paper copy, $7.75 in microfiche. Geological Survey Open-File Report 80-2044 (WRI), 1980. 39 p, 18 Fig, 1 Tab, 98 Ref.

Descriptors: *Hydrogeology, *Radioactive waste disposal, *Groundwater, *Aquifers, *Texas, Aquifer characteristics, Groundwater movement, Geohydrologic units, Evaluation, Northeast Texas, Salt domes.

The U.S. Department of Energy is considering the feasibility of using salt domes in the northeast Texas salt-dome basin as repositories for radioactive wastes that may require complete confinement for as much as 250,000 years. Four of fourteen known shallow piercement salt domes within the basin--Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes--have been selected as candidate domes for further study and possible selection as storage sites. Dissolution may exist at all four candidate salt domes, possibly through contact with Cretaceous or Tertiary aquifers, or through fault systems in the vicinity of the domes. Strata overlying and surrounding Palestine and Keechi Salt Domes have been arched into steeply-dipping folds that are complexly faulted. Similar conditions exist at Oakwood and Mount Sylvan Domes, except that the Tertiary strata have been only moderately disturbed. Cap rock, which is generally accepted to be an indication of salt dissolution, is present in varying amounts over all four domes. Saline water has been reported at the surface at all candidate domes except Oakwood, but only two water wells near the domes yield water containing possible anomalous concentrations of dissolved chloride--one at Keechi and one at Oakwood. Possible subsurface plumes of saline water, which are indications of instability, exist at all four domes. Additional problems concerning the hydrologic stability of Oakwood and Palestine salt domes have resulted from the disposal of oil-field saline water in the cap rock at the Oakwood dome and previous solution mining of salt at the Palestine dome. Additional investigations are needed to determine if a selected dome is hydrologically stable. Needed investigations include (1) more complete comparative analysis of the regional and local geohydrologic system; (2) a site-specific drilling and sampling program to analyze the cap rock-aquifer boundary, sediment distribution, hydraulic-parameter variations, hydraulic-head relationships, and hydrochemical patterns; and (3) mass-transport computer modeling of groundwater flow at the domes. REMOVAL AND RECOVERY OF METALS AND PHOSPHATES FROM MUNICIPAL SEWAGE SLUDGE,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
D. S. Scott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-221245, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-037, June, 1980. 45 p, 3 Fig, 15 Tab, 25 Ref. R-804669.

Descriptors: *Sludge disposal, *Metals, *Waste recovery, *Cost analysis, *Incineration, Chemical sludge, Activated sludge, Heavy metals, Waste water treatment, Phosphorus removal, Iron, Aluminum, Zinc, Magnesium, Nickel, Manganese, Chromium, Copper, Lead.

Incineration is the most rapidly growing method of sludge disposal despite problems with the quantity, and the phosphate and metals content of the ash. If it were possible to remove metals and phosphates from sludge prior to incineration, the resulting ash would be innocuous with a low metal content, the ash volumes would be reduced and the calorific value of the sludge feed to the incinerator would be enhanced. The technical and economic aspects of acid extracting heavy metals and phosphates from municipal chemical sludges and subsequently recovering them by lime neutralization were studied using an anaerobically digested chemical sludge to which ferric chloride had been added as a phosphate precipitant, and an aerobic waste activated sludge to which alum had been added for phosphate control. Adequate extractions of phosphorus, iron, aluminum, zinc, magnesium, nickel and manganese can be obtained from either sludge or filter cake at a pH of 1.5, using sulfuric acid. Chromium extractions vary from 50% to 90%, and copper cannot be extracted from anaerobic sludge, but does extract from aerobic systems. Lead is not extracted. The resulting acid extracted residual solids show removal of from 50% to 70% of the ash-forming inorganics. The calorific value increases from 30% to 40%. The cost of the extraction and recovery process is such that the value of recovered chemicals or metals will only pay 20% to 30% of estimated annual total cost. The major cost factor is the expense of reagents for recovery of chemicals. (Moore-SRC)

CHEMICAL AND BIOLOGICAL TREATMENT OF THERMALLY CONDITIONED SLUDGE RECYCLE LIQUORS,
Burgess and Niple Ltd., Columbus, OH.
M. B. Heyda, J. D. Edwards, and R. F. Noland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-213085, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-020, June, 1980. 75 p, 17 Fig, 22 Tab, 29 Ref. 11010 DKI.

Descriptors: *Sludge disposal, *Chemical treatment, *Biological treatment, Color removal, Waste water treatment, Biological oxygen demand, Heat treatment, Costs, Recycling, Lime, Clarification, Activated sludge process, Thermal conditioning.

Some municipal waste water treatment facilities use thermal conditioning as a sludge processing method. A by-product of this process is a highly concentrated recycle liquor which is often returned to the main treatment facilities; this may result in overloading the plant. The feasibility, effectiveness, and benefits of chemical and biological treatment processes for treating undiluted thermally conditioned sludge recycle liquors were evaluated. Chemical treatment consisted of hydrated lime addition followed by clarification. Biological treatment was achieved in a high rate activated sludge plant. Biochemical oxygen demand (5 day) averaged 26% for the chemical system and 93% for the biological system. Color was reduced in both systems by at least 90%. On a pollutant removal basis, biological treatment is cost effective. Total annual costs for treatment of recycle liquor generated from thermal conditioning of municipal sludges were: chemical, $0.012/kg; biological, $0.027/kg of sludge. (Moore-SRC)

Descriptors: *Metals, *Sludge treatment, *Acids, *Chelation, Trace elements, Separation techniques, Heavy metals, Sulfuric acid, Neutralization, Lime, Activated sludge, Ultimate disposal, Disposal, Chemical reactions, Chemical degradation, Zinc, Copper, Lead, Iron, Chromium, Cadmium, Nickel, Ethylenediamine tetraacetic acid.

Neither solubilization with sulfuric acid nor chelation with EDTA was an economically feasible method of removing toxic trace metals from sewage sludge prior to ultimate disposal in the ocean, on farmland, or by incineration. Chemical costs were up to $71.66 per metric ton for the acid-lime process, more for EDTA. In addition, the 5 to 10 fold dilution added undesirable amounts of water to the sludge. Lime was used to neutralize the acid and precipitate the metals. Metals were removed to a greater degree from the undigested sludges--primary and waste activated--than from digested sludges--primary and waste activated. In the 1 hour acid treatment, using between half and 2 times the stoichiometric dose, Pb, Cd, and Cu were the most difficult to solubilize. Fe, Cr, Ni, and Zn solubilized more readily. In EDTA treatment Cd and Ni removal were similar to acid treatment; Fe, Cr, and Zn less; and Pb and Cu significantly increased. (Cassar-FRC)

MUNICIPAL WASTE WATER REUTILIZATION ON CULTIVATED SOIL,
Brigham Young Univ., Provo, UT.
R. E. Terry, and R. L. Tate, III.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 85-88, January, 1981. 7 Tab, 15 Ref.

Descriptors: Ultimate disposal, Disposal, *Waste water disposal, *Nutrients, Grasses, Waste water treatment, Nitrogen compounds, Phosphorus compounds, Nitrates, Phosphates, Crops, Irrigation, Effluents, Everglades, Land application, Soil disposal fields, *Municipal waste water, *Water reuse, Agriculture.

Secondary effluent was effectively renovated in Pahokee muck, the most prevalent soil in the Everglades agricultural area. The optimum conditions for treatment were as follows: effluent application rate, less than 5 cm per week; use of a crop; and water table above 75 cm. Effluent or polishing pond water was applied at rates of 2.5, 5.0, and 7.5 cm per week for 19 weeks in a single application weekly to soil cores 95 cm long. More than 94% of added phosphate was retained by the soil; this was not affected by the loading rate. At 2.5 and 5.0 cm per week loading, 70% of the inorganic nitrogen was retained; 25% at the 7.5 cm per week rate. Comparisons with pond water and deionized water showed similar phosphate removal by the soil

More inorganic nitrogen appeared in the leachate when waste water effluent was applied to soil than when pond water was applied, in spite of the fact that inorganic nitrogen levels in both liquids were similar. (Cassar-FRC)

Research Publication No 84, 1980. 16 p, 7 Fig, 1 Tab, 12 Ref.

Descriptors: *Chlorination, Water pollution sources, *Water treatment, *Microbiological studies, *Chlorinated hydrocarbons, Pollutants, Water pollution effects, Drinking water, Hydrocarbons, Pollutant identification, Potable water, Water pollution control, Pollutant identification, Bioindicators, Chemical treatment, Clarification, Water use efficiency, Water quality control, Water quality, Water conditioning.

The effect of removing the prechlorination stage (a stage implicated in the formation of trihalomethanes (THM) in drinking water, but employed by water plants using surface water to control biological growth in settling tanks and filters, to increase coagulation efficiency, and lengthening the water-chlorine contact time, increasing disinfection efficiency) from the treatment process was studied on a plant scale both with respect to the microbiological quality of the produced water and its THM content. THM levels produced at three Metro Toronto water plants were studied with/without prechlorination. With prechlorination, average total THM ranged 10.1-14.9 micrograms/liter, well within the maximum acceptable concentration defined in the Guidelines for Canadian Drinking Water Quality (350 micrograms/liter). Without prechlorination, THM production appeared lower on the average but organisms of sanitary significance regularly reached the final disinfection stage and plankton counts increased in the finished water; problems with plant operation also developed. Prechlorination stage omission should only be considered where properly-designed chlorine contact facilities are available, ensuring adequate retention times during final disinfection. DENITRIFICATION OF WATER FOR HUMAN CONSUMPTION,
Societe Generale d'Epuration et d'Assainissement Degremont, Suresnes (France). Dept. of Physical-Chemical Research.
Y. Richard, A. Leprince, G. Martin, and C. Leblanc.
Progress in Water Technology, Vol 12, p 173-191, 1980. 11 Fig, 5 Tab, 14 Ref.

Descriptors: *Denitrification, *Potable water, *Model studies, Nitrification, *Water treatment, Waste water treatment, Phosphorus, Carbon, Nitrogen, Nitrates, Nitrites, Biological treatment, Sludge, Filters, Consumptive use.

A biological denitrification process for the removal of nitrates in water destined for human use is described. The process uses submerged, upward-flow type anaerobic filters and fixed or expanded beds depending on the rising velocity of the water and the characteristics of the support material. The treatment of nitrogenous pollution in water destined for potable use must apply new removal processes different from those used for the nitrification/denitrification of waste waters. Models are proposed for the specific properties of expanded beds which allow calculation of the maximum denitrification rate and the half-saturation coefficient with respect to phosphorus. During routine operating conditions the removal of nitrates in an expanded bed reactor is controlled by the concentration of the sludge, the concentration of the support material, and the height, fluid velocity and temperature. The denitrification reaction is zero-order with respect to phosphorus, carbon, and nitrogen. (Geiger-FRC)

PROCESS FOR PURIFICATION OF CONTAMINATED WATER,
G. A. Guter.
U.S. Patent No 4,206,048, 7 p, 1 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 995, No 1, p 226-227, June 3, 1980.

Descriptors: *Patents, *Water treatment, *Water purification, Separation techniques, *Reverse osmosis, Membrane processes, Anion exchange, Nitrates, Potable water, Chlorides, Regeneration.

A process removes nitrate ions from a contaminated aqueous feed solution and also chloride ion, by forcing the solution through a reverse osmosis membrane which permits passage of nitrate ions through the membrane and into the product water while rejecting chloride ion and other anions such as sulfate and bicarbonate, and concentrating such anions in the brine waste water. An anion exchange resin bed charged in the chloride form is placed in the product water during the reverse osmosis operation. Reverse osmosis product water containing nitrate is treated by the anion exchange resin bed to remove the nitrate ions and replace them with chloride ions. The resulting product water is essentially free of the nitrate impurity and a concentrated waste brine stream is obtained containing essentially chloride salts. When such anion exchange bed has exhausted the chloride ions and becomes loaded with nitrate ions, the resulting anion exchange resin is placed in the concentrated waste brine stream to regenerate the anion exchange resin with an equivalent amount of chloride ion, liberating the nitrate ion in concentrated form into the waste brine concentrate stream. The same process will remove contaminant ions similar to nitrate such as arsenate, selenate and borate. (Sinha-OEIS)

RAW WATER STUDIES DETERMINE SITING OF NEW INTAKE,
Ottawa-Carleton Regional Municipality (Ontario). Works Dept.
B. C. Hutcheon, and D. W. Smith.
Journal of the American Water Works Association, Vol 73, No 1, p 16-23, January, 1981. 3 Fig, 3 Tab, 7 Ref.

Descriptors: *Sampling, *Water quality, Intakes, *Odor, Taste, Runoff, Raw water, Rivers, Frazil ice, Ice, Urbanization, Precipitation, Britannia Plant, Drinking water, *Ottawa, Coliforms, Sites.

The City of Ottawa experienced severe taste and odor problems in drinking water, particularly during spring runoff and after major storms, after construction of the Britannia Plant in 1961. This plant draws its raw water from the Ottawa River. After several attempts to improve water quality by diversion and activated carbon treatment, it was decided to relocate the intake. During a 4-year sampling program, special methods were developed to surmount difficulties from adverse weather, floods, and ice. Sampling stations were installed on the river bottom, and water was conducted to the basement of the plant through plastic hoses. Thus samples were easily available at all times. As a result of the study, the intake was extended 500 feet beyond the original intake. Intake capacity was 96 mgd; diameter, 78 inches. To combat frazil ice, intake bells were made of fiberglass reinforced plastic and the maximum design approach velocity limited to 4.5 inches per second at peak flow. Since these modifications were completed in 1977, no adverse water conditions have resulted from intense storms or spring runoff. (Cassar-FRC)

5G. Water Quality Control

SUPPLEMENTAL REPORT ON PHOSPHORUS MANAGEMENT STRATEGIES.
International Joint Commission-United States and Canada.
Report, January 30, 1981. 24 p, 3 Append.

Descriptors: *Phosphorus, *Nutrients, *Water quality standards, International agreements, *International waters, *Canada, Management planning, Phosphorus compounds, Phosphorus removal, Pollution load, Nutrient requirements, Planning, International commissions, Organizations, Water quality, Water quality control, Water quality management, Water properties, Water pollution control.

The International Joint Commission (IJC) confirmed that the target loads in Annex 3 (given in Appendix B) of the 1978 Great Lakes Water Quality Agreement are the best presently available estimates of maximum annual phosphorus loads that would achieve Agreement goals. Provided the target loads are adopted, the IJC presents a strategy to attain them, primarily an expansion of the strategy that the IJC's Pollution from Land Use Activities Reference Group (PLUARG) found to be most cost effective of the measures studied. IJC notes that other cost-effective strategies to attain target loads may also be possible, and that target loads were based on scientific and technical considerations. Other factors that might be considered in the development of target loads and programs to meet them include projected impacts of current control programs, biological availability, nearshore problems, and socio-economic considerations. The IJC Governments need to confirm target loads by

May 22, 1981. If further consideration of any of these factors is needed, an intensive study program is recommended, together with an interim strategy of phosphorus management. (Zielinski-IPA)

GREAT LAKES SCIENCE ADVISORY BOARD: REPORT OF THE AQUATIC ECOSYSTEM OBJECTIVES COMMITTEE.
International Joint Commission-United States and Canada, Windsor (Ontario).
Report, November, 1980. 127 p, 5 Fig, 17 Tab, 290 Ref.

Descriptors: *International waters, *Great Lakes, International agreements, *Canada, *Water quality standards, Pollutants, Pollution load, Management planning, Planning, International commissions, Water quality, Water quality control, Water quality management, Water pollution control, Halogenated pesticides, Residual chlorine, Cyanide, Trace metals, Nutrients, Water temperature, Nutrient requirements.

The objectives and activities of the Aquatic Ecosystem Objectives Committee (AEOC), with regard to the 1978 Great Lakes Water Quality Agreement (GLWQA), were summarized and discussed. Objectives and supporting rationale for a number of materials and factors related to water quality were reviewed. The AEOC recommended adoption of specific objectives into the 1978 GLWQA. These recommendations included that: a pentachlorophenol aqueous concentration of 0.4 micrograms/liter (mcgs/l) should not be exceeded; 2,3,7,8-tetrachlorodibenzo-para-dioxin (TCDD) should be absent from all ecosystem compartments; water used for body contact recreation activities should be substantially free from bacteria/fungi/viruses that may produce enteric disorders, infections or diseases, and that fecal coliform bacteria levels should not exceed a logarithmic mean of 200 fecal coliforms per 100 milliliters; total lead concentrations in unfiltered water should not exceed 2,3,4, and 5 mcgs/l in Lakes Superior, Huron, Erie (or Michigan), and Ontario, respectively; total residual chlorine should not exceed 2 mcgs/l; total silver and free cyanide in unfiltered water should not exceed 0.1 and 5 mcgs/l, respectively. Recommendations concerning temperature and nutrients were also developed. (Zielinski-IPA)

TREATMENT OF IRRIGATION WATER FOR THE REMOVAL OF FUNGI AND NEMATODES,
South Africa Co-Operation Citrus Exchange, Nelspruit.
A. Hough.
The Citrus and Subtropical Fruit Journal (Johannesburg), No 547, p 20, June, 1979.

Descriptors: *Fungi, *Nematodes, *Water pollution sources, *Irrigation water, *Water treatment, Water purification, Filtration, Water quality, Aquatic fungi, Pathogenic fungi, Soil fungi, Fungicides, Microorganisms, Plant diseases, Spores, Aquatic animals, Aquatic microorganisms, Irrigated land, Irrigation practices, Reservoir operation, Runoff, Chlorination, *South Africa.

Contaminated irrigation water is the major source of infestation of arable soil and disease of crop plants with fungi and nematodes. Irrigation water becomes contaminated from river water derived from heavy rain run-off picking up soil-borne fungal spores and nematodes. Analysis of Crocodile River water near Nelspruit indicated that 500 million Phytophthora spores, 2 billion Pythium spores and 0.5 million citrus nematode larvae are added to one hectare of land for every 100 mm of irrigation water applied. Irrigation water can be improved by storage in dams for a few weeks. Water treatment with a general biocide like chlorine has little effect. Ultraviolet irradiation is also of little help when water quality is not high. Preliminary filtration is usually used prior to such treatments. Flocculation with aluminum sulfate and Floccutan and sand filtration can be used, or alternately, water can be pumped downwards through a series of graded sand filters, but free-swimming spores are not retained. Further filtration through a cartridge filter coated with diatomaceous earth or powdered vermisculite is required. Exposure of spores to one part-per-million free available chlorine for ten minutes is then required for final water sterilization. (Zielinski-IPA)

TECHNIQUES FOR CREATING SALT MARSHES ALONG THE EAST COAST,
North Carolina State Univ. at Raleigh.
E. D. Seneca.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 1-5. 4 Ref.

Descriptors: *Vegetation establishment, *Marsh management, *Salt marshes, *North Carolina, Marsh plants, Dredging, Spoil banks, Estuarine environment, Salinity, Shoreline cover, Coasts.

Open water disposal of dredge material was previously carried out in North Carolina. In an effort to stabilize the intertidal zone of this dredge material by the establishment of salt marshes, smooth cordgrass was transplanted or seeded into areas of dredge spoil along the coast. Two full above-ground growing seasons or about 17 months are required for transplants to develop the root and rhizome network that binds the substrate together. Transplants can be dug at about 150 to 200 transplants per man-hour and planted at the same rate with persons working in a two-man team. Transplants can be obtained about twice as rapidly with mechanical equipment. Seeds can be stored in either instant ocean or estuarine water at about 2 to 4C. Direct seeding is feasible only in the upper half of the intertidal zone. For smooth cordgrass to maintain itself, salinities around 20 ppt are necessary; for salinities of 5 to 10 ppt, smooth cordgrass will not remain dominant more than 3 or 4 years. The marsh will then be invaded by other species, which is not necessarily bad because neither substrate stabilization nor marsh creation is lost. In stabilizing estuarine shorelines, vegetation is in certain situations a logical alternative to man-made structures. (Moore-SRC)

CREATION OF A SOUTHEASTERN UNITED STATES SALT MARSH ON DREDGED MATERIAL,
Georgia Dept. of Natural Resources, Brunswick. Coastal Resources Div.
R. J. Reimold.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 6-22. 10 Fig, 4 Tab.

Descriptors: *Marsh management, *Salt marshes, *Marsh plants, *Vegetation establishment, Spoil banks, Estuarine environment, *Georgia, Dredging, Water chemistry, Nitrogen, Phosphorus, Fertilization, Coasts.

Often it may be necessary to supplement the nutrient content of soils with commercial fertilized applications so that marsh plants can become successfully established. Marsh plant, soil interactions were evaluated in terms of carbon, nitrogen, and phosphorus levels to gain information about nutrient uptake by marsh plants and to determine marsh plant response to fertilizer application. The site used for these studies was Buttermilk Sound, Georgia, which had been used for disposal of dredged material. Amounts of nitrogen and phosphorus in the water column appear to follow the typical estuarine pattern of high concentrations in winter and low concentrations in summer. There has been no evidence of eutrophication from the fertilizer added to the test plots. Sprigs of seven plants commonly found in natural marshes near the study site were transplanted during June 1975 to the research plot. At destructive sampling in November 1975, sprig height, culm density, aerial biomass, and below ground biomass of macroorganic material were determined and compared with the same parameters at transplantation. All seven of the plants showed an increase in sprig height, aerial biomass, and below ground biomass: all except Iva frutescens showed an increase in culm density. The greatest increase in culm density was found in Spartina patens, from 10/square m to 321.5/square m. (Moore-SRC)

TECHNIQUES FOR CREATING SALT MARSHES ALONG THE CALIFORNIA COAST,
H. L. Mason.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 23-24.

Descriptors: *Salt marshes, *Marsh management, *Spartina, *Vegetation establishment, Dredging, Spoil banks, Coasts, Wetlands, Marsh plants, *California.

Spartina seed may be difficult to find on the West Coast; a good way to locate Spartina seed is to look for a patch that is infested with ergot because there has to be an embryo present before the ergot becomes established. A team of two men in a boat can harvest seed by one using a pole to push the plant over the boat while the second man snips off the seed heads with hedge pruning shears. In two days two men harvested enough seed to fill three 55-gallon drums. Seed can be stored in water under refrigeration. Some seed germinates while under storage. Cuttings from the rhizomes and fall buds both proved satisfactory for planting. Spoil banks can be planted and fertilized. The first year the plants did not grow much, but the second year they were growing fairly well, and by the third year some single bud cuttings had 15 shoots coming up. The best area for planting was in the lower tidal area. Establishment was very good beyond the area of the low-low tide and high-low tide. (Moore-SRC)

SALT MARSH CREATION IN THE PACIFIC NORTHWEST: CRITERIA, PLANTING TECHNIQUES, AND COSTS,
Wave Beach Grass Nursery, Florence, OR.
W. E. Ternyik.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November 1980, p 25-27. 1 Tab.

Descriptors: *Marsh management, *Salt marshes, *Marsh plants, *Vegetation establishment, *Oregon, Estuarine environment, Coasts, Dredging, Wetlands, Spoil banks.

Pilot test planting of six species of vascular plants endemic to the area was carried out at Mill Sands, Oregon on dredged material. Species selected for planting were Eleocharis palustris, Junc

balticus, J. effusus, Scirpus validus, Carex lyngbyei, and Deschampsia caespitosa. Plants were selected as near to the early growth stage as possible to avoid possible shock. Sites for plant collection were selected based on quality and vigor of plants, state of growth, site location, plant age, quantity of plant stock, and similarity to the test plot. All plants were hand dug, cleaned and divided. The initial storage method was to heel-in prepared plants in sandy intertidal areas, but this method was quickly discarded when it was found that the plants were so firmly settled after one tide that major damage occurred in removal. The second method was storage in plastic containers in the intertidal marsh areas. Some plants were stored up to 5 days without any problems. No site preparation was necessary, because of the even, flat terrain and uniform sand material. Fertilized plots all received a single application of 11-55-0 pelleted fertilizer. The growing season was followed from June 1975 to November 1975. Cost estimates for large scale plantings can be developed after two more years. (Moore-SRC)

SALT MARSH SOIL DEVELOPMENT,
Delaware Univ., Lewes. Coll. of Marine Studies.
J. L. Gallagher.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 28-34. 3 Tab, 10 Ref.

Descriptors: *Salt marshes, *Marsh management, *Soil formation, Marsh plants, Vegetation establishment, Nutrients, Soil management, Salinity, Soil chemistry, Soil physical properties, Coasts, Wetlands.

Salt marsh creation may be considered to be basically a problem of developing salt marsh soils from marine sediments. Sediments from which natural marshes develop are tidally deposited, resulting in rather uniform grain size fractionation. Dredging is the usual method of deposition of sediments for marshes created artificially on the coast. This technique leads to complex and variable parent material, making the establishment of proper conditions for plant growth difficult. Most marsh soils are either Histosols or Entisols. The problems associated with the development of salt marsh soils from marine sediments include: stability, acidity, moisture, salinity, and nutrients. There are certain plants, occurring in the natural marsh, that have characteristics which may make them useful in facilitating certain desired changes in the substrate. Sporobolus virginicus, Distichlis spicata, and Salicornia virginica are tolerant of a wide range of salinities, while Spartina patens is adaptable to growth in the upper marsh and drier areas. The depth of roots may be important for stabilizing soils of for preventing roots from penetrating a soil zone which is inhospitable or may contain a contaminant that could be translocated to aerial food webs. (Moore-SRC)

SALT MARSH SUBSTRATE INTERACTION: MICROORGANISMS,
Skidaway Inst. of Oceanography, Savannah, GA.
R. B. Hanson.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 35-52. 12 Fig, 2 Tab, 10 Ref.

Descriptors: *Salt marshes, *Microorganisms, *Substrates, *Marsh plants, *Georgia, Estuarine environment, Coasts, Dredging, Ecosystem, Aquatic habitats, Algae, Yeasts, Bacteria, Cycling nutrients, Protozoa, Invertebrates, Buttermilk Sound.

Information on microbial development is needed so that comprehensive guidelines can be formulated for coastal ecosystem habitat development. Microbial colonization in dredge materials planted with marsh plants was investigated at Buttermilk Sound, Georgia. From January to July, the concentration of ATP increased in the surface stratum but ATP concentrations remained unchanged in the 5 to 7 cm and 10 to 12 cm strata. The decrease in ATP biomass with depth suggests that the carbon input is from the surface, and the source of carbon may be from the detrital and algal carbon deposited on the surface. In the surface stratum, the bacterial populations were generally greater than 500,000 colony forming units per gram dry weight. The populations were generally an order of magnitude lower in the substrata than in the surface stratum. The medium to coarse sands at the dredged site may account for the low population density. The yeast population decreased with depth similar to the bacterial populations and ATP concentrations. The diversity of the benthic algal community increased between January and September. Protozoans and meiofauna were found in most sediments, and the fauna were more abundant toward the end of the summer. Based on available information, nutrient regeneration by microbenthos and macrobenthos, and tidal input of detritus play an essential role in coastal ecosystem development. (Moore-SRC)

MANGROVE SWAMP CREATION,
Miami Univ., Coral Gables, FL. Dept. of Biology.
H. J. Teas.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 63-90. 21 Fig, 39 Ref.

Descriptors: *Mangrove swamps, *Vegetation establishment, *Management, Wetlands, Brackish water, Estuarine environment, Salinity, Coasts, Tidal effects, Light intensity, Wave action, Sediment erosion, Stabilization, *Florida.

A mangrove swamp is a complex ecosystem. Although the species of plants are relatively few, the animals are numerous and diverse. The goal of a mangrove planting or replanting program should be the development of a functional, diverse ecosystem. Mangroves require open sunlight for optimal growth. The light intensity at ground level under a full canopy of mangrove forest may only be 5% to 10% of the open sun values, which is less than seedlings require. Another factor in mangrove establishment is tidal depth. Mangroves do not become established at substrate elevations substantially below mean sea level, and decreased tidal flushing may kill mangroves, especially red mangroves. Mangroves tolerate, but do not require saltwater. Mangroves may grow larger in the zone of lower, fluctuating salinities some distance into an estuary from the shore than they do in saline waters near the shore. Shoreline energy from natural waves, currents, and boat wakes can wash out or topple mangroves. The relatively greater resistance to wave erosion of the root systems of the black and white mangroves in comparison with red mangroves is an important factor in shoreline stabilization and mangrove swamp creation. Another enemy of mangrove seedling establishment is floating trash that can cover, uproot, or break off seedlings. Some soils, such as broken coral and nutrient deficient leached soils, provide poor substrates for mangrove development. Root parasites, fungus diseases, and damage by the public also may effect mangrove seedling establishment. (Moore-SRC)

A PROCESS FOR COMMUNITY FLOOD PLAIN MANAGEMENT, SUMMARY REPORT.
Leman Powell Associates, Inc., Alexandria, VA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185282, Price codes: A03 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT TT/80 1 April, 1980. 22 p, 6 Fig, 1 Tab. OWRT-C-90066-T(No 9616)(1).

Descriptors: *Flood plains, *Flood protection, *Water management(Applied), *Planning, *Flood control, Civil engineering, Flood damage, Flood flow, Personnel, Warning systems, Flood routing, Flow, Forecasting, Peak discharge, Floods, Hydrology, Runoff, Floodplain zoning, Floodways, Discharge(Water), Flow control.

This summary report calls attention to promising methods for managing flood plains, and was derived from a more extensive Office of Water Research and Technology planning manual (A Process for Community Flood Plain Management) which details the concepts of flood plain management to assist a community to develop sound programs. Flood plain management involves the analysis and integration of measures used to prevent/mitigate flood damage in a given location to protect and preserve natural/environmental/historical/cultural values of the plain; employment of trained staff; and an understanding of the nature of floods, their expected frequency, and their impact on the land under consideration. Flood hazard potential must be assessed relative to available physical data, the economic role of the flood plain, and social impacts of flooding, among others. Management approaches include reducing flooding susceptibility, flood modification, and flood impact modification. Pertinent Federal law related to flood plain management is summarized, as well as available sources of assistance to communities. Finally, the features of the flood plain management process as a continuing program are delineated. (Zielinski-IPA)

AUTOMATIC COMPUTERIZED COMPUTATION OF AN OPTIMAL SEWERAGE NETWORK BY DYNAMIC PROGRAMMING,
Tahal Consulting Engineers Ltd., Tel Aviv (Israel).
E. Kally.
Water Services, Vol 84, No 1018, p 723-725, December, 1980. 3 Fig, 2 Tab, 3 Ref.

Descriptors: *Computers, *Sewage, *Cost analysis, Optimization, Programs, Planning, Data processing, Project planning, Estimated costs.

Computer design of a sewage system produced an optimum system at 10% lower cost than a manually calculated method. Other advantages were: all requirements were met (maximum and minimum streamflow velocities, maximum and minimum ratio of depth of water flowing in pipe to pipe diameter, minimum pipe slope, maximum and minimum excavation depth), human errors were eliminated, and results were presented in a clear and complete printout. The network was made of sections of pipes stretching between manholes in a loopless format, and used gravitational flow. (Cassar-FRC)

A USABLE INPUT-OUTPUT FLOW CHART OF A MUNICIPAL WATER SYSTEM,
Consoer Townsend Harris International, Inc., San Juan (Puerto Rico).
V. Bengoechea, D. W. Hendricks, and R. E. Krempel.
Journal of the American Water Works Association, Vol 73, No 1, p 3-8, January, 1981. 3 Fig, 3 Tab, 3 Ref.

Descriptors: *Systems analysis, *Input-output analysis, *Water distribution, Distribution, Water supply, *Fort Collins, Colorado, Planning, Decision making, Management, Municipal water.

An input-output water transactions table is a systems analysis tool useful for understanding and communicating the many interacting components in a municipal water system. An example featuring the Fort Collins, Colorado, water system is presented. The matrix contains 65 outputs (10 entries and 55 internal components) and 68 inputs (13 exits and 55 internal components), 200 water transfers, and 133 totals of water distributed to and from various components. Typical entries are river flow, reservoir storage, and infiltration of groundwater into the sewer system. Typical exits are groundwater, the atmosphere, and water sold to other distribution systems. Internal components may be raw water, treatment plants, distribution systems, users, and sewage treatment plants. All this information is displayed on an 8 feet square color-coded magnetic board. One inch squares are labeled with different colored magnetic strips. Information may be moved around and changed easily. The mass balance principle is applied. That is, the total system input = total output. For internal components the sum of inputs = sum of outputs. (Cassar-FRC)

WATER RESOURCES PROBLEMS AND RESEARCH NEEDS, NEW YORK STATE, 1982-1987.
Cornell Univ., Ithaca, NY. Center for Environmental Research.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185357, Price codes: A07 in paper copy, A01 in microfiche. Report, October, 1980. 133 p, 24 Fig, 11 Tab, 54 Ref, 1 Append.

Descriptors: *Research priorities, *New York, *Planning, *Research and development, *Water resources development, Water resources hazards, Poisons, Safety, Federal Government, Management, Institutions, Project planning, Water quality, Water pollution, Water pollution sources, Water pollution treatment, Chemical wastes, Effluents.

Most of New York State water is derived from surface waters, mostly for electric utilities/industries use with relatively small use for public supplies; while groundwater uses are proportionately higher for public and rural private uses. Water problems have been identified in four areas: water quantity (urban water systems deterioration; expansion; inadequate management); water quality (groundwater contamination; hazardous wastes; non-point source pollution and eutrophication); flooding (inadequate floodplain management and flood warning/emergency measures); and environmental impacts (wet lands degradation/elimination; stream quality/quantity and coastal zone deterioration). Identified research needs were classified into critical, urgent, or important priority categories. Critical priorities included: (1) land use versus contaminant production and movement to the water table; (2) interaction of potential contaminants and acid precipitation with ecosystems; (3) hazardous wastes health/economic impacts; (4) potential synergistic effects of hazardous chemicals in waters; (5) use of hydrologic and water quality models to enhance planning, and detection/monitoring systems for hazardous waste; and (6) improved data on hazardous waste production/location/chemical composition. POLICY ANALYSIS OF RESERVOIR OPERATION IN THE POTOMAC RIVER BASIN, VOLUME I, EXECUTIVE SUMMARY,
Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
R. N. Palmer, J. R. Wright, J. A. Smith, J. L. Cohon, and C. S. ReVelle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185407, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, (1980). Maryland Water Resources Research Center, University of Maryland, College Park, Technical Report No 59. 30 p, 4 Fig, 2 Tab. OWRT-B-027-MD(3), 14-34-0001-8089.

Descriptors: *Policy making, Decision making, Optimization, *Reservoir operation, River basins, *Computer models, Administrative decisions, Systems analysis, Optimum development, *Simulation analysis, Plans, Planning, Resources development, Reservoir storage, Reservoirs, Mathematical studies, Simulation, Model studies, Evaluation, Estimating, Prediction, *Potomac River basin.

The first volume of the final report of the project study on policy analysis of Potomac River Basin reservoir operation represents a summary of those models and project study results and water supply management in the Washington, D.C. Metropolitan area discussed in detail in Volumes II and III. Purposes and assumptions of the models and the major results are emphasized. The first year of the two-year study (1977-79) concerned formulation and solution of optimization models for determining Washington water supply system limits, and for explaining tradeoffs between conflicting water uses. With optimal and prescient reservoir operation, the water supply system yield is significantly higher and useful life substantially longer than previously thought. Upstream demands and Washington area water supply are in conflict in subtle ways, but not to the same degree over all values upstream demand. The second year project focus was on development of the Potomac River Interactive Simulation Model (PRISM), a policy tool found more valuable than optimization models. The Low Flow Allocation Agreement, a unique low flow compact for Washington water management was included in PRISM. Experience with PRISM indicated planners and decision makers have learned about Washington water supply management from PRISM sessions. (Zielinski-IPA)

POLICY ANALYSIS OF RESERVOIR OPERATION IN THE POTOMAC RIVER BASIN, VOLUME II, LIMITS OF THE WASHINGTON METROPOLITAN WATER SUPPLY SYSTEM,
Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
R. N. Palmer, J. R. Wright, J. A. Smith, J. L. Cohon, and C. S. ReVelle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185415, Price codes: A07 in paper copy, A01 in microfiche. Completion Report, (1980). Maryland Water Resources Research Center, University of Maryland, College Park, Technical Report No 59. 132 p, 16 Fig, 47 Tab, 81 Ref, 3 Append. OWRT-B-027-MD(3), 14-34-0001-8089.

Descriptors: Decision making, *Computer models, River basins, *Policy making, *Simulation analysis, *Reservoir operation, Optimization, Administrative decision, Systems analysis, Optimum development plans, Resources development, Planning, Reservoirs, Reservoir storage, Mathematical studies, Prediction, Model studies, Simulation, Evaluation, Estimating, *Potomac River basin.

The focus of the volume is on mathematical programming models and their use in generating information about important tradeoffs in water allocation. The study examined the limits of the water supply system serving the Washington (D.C.) Metropolitan Area (WMA), and the potential yield of each individual reservoir that contributes to WMA's water supply was investigated. The theoretical limit of conjunctive operation of all reservoirs in meeting constant demand was determined using a Hypothetical Reservoir Operation procedure, while practical yield of that system was determined by an Optimal Integration Procedure. This Procedure was applied to the more complex system of the reservoirs, plus the largely unregulated Potomac River, with the resulting establishment of a series of monthly operating rules for the reservoir system. Further, a Linear-System Yield Determination formulation was developed to establish system yield for certain capacity and operating constraints. Monthly demand functions were incorporated with constraints reflecting current and future conditions. System yields obtained by exploration of different scenarios allowed for determination of attainable operating goals for the WMA water supply system. The interactive PRISM model, incorporating low river flows, is described in Volume III. (Zielinski-IPA)

POLICY ANALYSIS OF RESERVOIR OPERATION IN THE POTOMAC RIVER BASIN, VOLUME III, POTOMAC RIVER INTERACTIVE SIMULATION MODEL,
Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
R. N. Palmer, J. R. Wright, J. A. Smith, J. L. Cohon, and C. S. ReVelle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185423, Price codes: A09 in paper copy, A01 in microfiche. Completion Report, (1980). Maryland Water Resources Research Center, University of Maryland, College Park, Technical Report No 59. 181 p, 50 Fig, 27 Tab, 13 Ref, 3 Append. OWRT-B-027-MD(3), 14-34-0001-8089.

Descriptors: *Computer models, *Simulation analysis, *Policy making, River basins, Decision making, *Reservoir operation, Optimization, Optimum development plans, Systems analysis, Administrative decisions, Reservoir storage, Resources development, Planning, Model studies, Prediction, Estimating, Evaluation, Simulation, Mathematical studies, Reservoirs, *Potomac River basin.

The final volume of the report describes development of the Potomac River Interactive Simulation Model (PRISM), a policy tool which is both more realistic than optimization models (Volume II) in its representation of the Potomac Basin and the Washington Metropolitan Area (WMA) water supply system, and potentially more useful to planners and decision makers. Because certain constraint inputs to linear programming modeling (Volume II) was not possible, another model (PRISM) of the WMA water supply was developed. PRISM, a descriptive model, illustrates what would result from a given operating policy. PRISM is designed to simulate potential reservoir operation and water supply management policies during periods of drought. Inflows, storages, and releases of the upstream reservoirs were calculated weekly and their impact on water available to the WMA evaluated. Downstream reservoir operation was simulated weekly, together with average monthly regional water demands. From these factors, potential deficits in water availability for each region were calculated. Where Corps of Engineers planning assumptions forecast no supply problems in the year 2005, use of historic flows forecast that up to 18 weeks of deficit would occur; PRISM analysis showed these anticipated deficits to be due more to inflexible operating policy than to water storage shortage. OPTIMAL EXPANSION OF A WATER RESOURCE SYSTEM AND ISSUES OF WATER ALLOCATION AND UTILIZATION: UMATILLA RIVER BASIN, OREGON,
Oregon State Univ., Corvallis.
B. H. Lin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185316, Price codes: A09 in paper copy, A01 in microfiche. Master of Science Thesis, June, 1981. 166 p, 10 Fig, 28 Tab, 56 Ref, 5 Append. OWRT-A-046-ORE(1).

Descriptors: *Water resources development, *Oregon, *River basin development, *Model studies, *Optimization, Water allocation, Resources development, Water supply development, Computer, Models, Systems analysis, Resource allocation, Water use, Estimated benefits, Evaluation, Economic aspects, Agriculture, Fisheries, Irrigation, *Umatilla River basin.

This study explored the merits of scheduling water resource project facilities on the basis of the anticipated economic benefits provided. Using the Umatilla River Basin in northeast Oregon as a case study example, the facilities (and their alternatives) of a previously-planned Federal water resource development project in that area were analyzed relative to the magnitude and timing of anticipated costs and benefits, focusing on irrigated agriculture and fishery development/enhancement benefits. A basic scheduling model was designed, aimed at maximizing the present value of net benefits (PVNB) inherent in an optimally-timed set of facilities subject to an annual budget constraint. It was found that the PVNB of the project could be significantly enhanced when compared to the original schedule proposed in the project planning documents. Incorporation of considerations of tradeoffs/exchanges between project beneficiaries into the capacity expansion mode of the planning process was of even greater interest. These interrelationships were explored with special attention to the manner in which water exchanges (via water rights transfers) could establish higher benefit levels in future years. (Zielinski-IPA)

CONFLICTS OVER THE COLUMBIA RIVER, SEMINAR CONDUCTED BY WATER RESOURCES RESEARCH INSTITUTE, OREGON STATE UNIVERSITY, SPRING QUARTER 1980.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185191, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Institute, Oregon State Univ., Corvallis. Report SEMIN WR 028-80, July, 1980. 107 p, 10 Fig, 9 Tab, 42 Ref. OWRT-A-999-ORE(26).

Descriptors: *Columbia River, *Oregon, *Fish management, *Water policy, *International waters, Water quality, Planning, Drainage systems, Estuaries, Riverflow, River systems, Hydroelectric power, Treaties, Water quality control, Water utilization, Water sources, Water supply, Alternative water use, Recreation, Riparian rights, Reasonable use.

A recent report of the Pacific Northwest River Basins Commission discussed the Columbia River characteristics. Some of the factors involved were presented in this Seminar, covering: River uses; concern over the Columbia estuary; fish management and protection; River protein/power/preservation/politics; Indian fishing; costs/benefits/trade-offs of agriculture and hydro-power; River water quality; international management; and navigation. In terms of river use, the main stem of the Columbia is essentially fully developed. However, there is much work to be done on the tributaries, and the key to tributary development is upstream storage. The Columbia River Estuary Data Development Program was described in terms of its functions and products. The early 1980's will be a transition period for salmon/steelhead; accomplishments in river management/protection during the next five years will be critical to survival of upriver runs. Under the Treaty agreement with Canada, both nations have derived substantial electrical energy at markedly less cost than had alternative sources been developed independently; this is also true for flood hazard mitigation. Commercial navigation must be considered along with other Columbia Basin water uses in the policy-making process. (Zielinski-IPA)

A BUILDER'S GUIDE TO WATER AND ENERGY,
Alaska Univ., Fairbanks. Inst. of Water Resources.
R. D. Seifert, and L. P. Dwight.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185217, Price codes: A05 in paper copy, A01 in microfiche. Report IWR-100, August, 1980. 78 p, 8 Fig, 10 Tab, 28 Ref, 4 Append. OWRT-A-065-ALAS(2).

Descriptors: *Alaska, Building codes, *Urbanization, *Design criteria, *Planning, *Water utilization, Optimum development plans, Energy dissipation, Construction, Construction materials, Design standards, Fabrication, Structures, Water demand, Efficiencies, Energy loss, Energy conservation, City planning, Suburban studies, Cities, Human population, Economics.

This Guide was designed to aid those who are developing or improving a piece of property in Alaska. It will also be useful to those considering investing in Alaskan property, especially those building in urban/suburban areas. Information on water and energy, while theoretically available to the Alaskan home builder and property developer, has been difficult to glean from the widely diverse sources. The Guide discusses this variety of planning considerations - ranging from the selecting of a lot to the fine points of energy conservation - in the chronological order needed by the builder. Topics include selecting the actual building site, water access, sewage disposal, energy access, energy conservation, tax credits, and government regulations. The Guide provides step-by-step assistance for developing a site and building upon it, while taking maximum advantage of a site's best characteristics and minimizing its shortcomings. (Zielinski-IPA)

AGRICULTURAL WATER DEMAND PREDICTION USING REMOTE SENSING TECHNOLOGY FOR GEORGIA RESOURCE MANAGEMENT,
Georgia Univ., Athens. Dept. of Geography.
J. R. Jensen, and D. L. Chery.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184137, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, December, 1980. Environmental Resources Center, Georgia Institute of Technology, Atlanta, Report ERC 07-80. 47 p, 15 Fig, 2 Tab, 54 Ref, 1 Append. OWRT-A-083-GA(1).

Descriptors: *Water demand, Agriculture, *Remote sensing, *Prediction, *Irrigation requirements, *Georgia, Computer models, Hydrologic budget, *Evapotranspiration, Agricultural watersheds, Watersheds, Irrigation practices, Irrigation efficiency, Sensors, Resources management, Water management, Evapotranspiration potential, Hydrologic aspects, Hydrologic models, Hydrologic equation, Hydrologic data.

In many areas of well water irrigation, an expedient and simple method is needed for assessing the amount of water pumped from aquifers or the effect of intensive agriculture on watershed water balance (WWB). Certain measurements are needed to model WWB, with the major flow components being (1) rainfall input, and (2) outflows of evapotranspiration (ET) and surface and subsurface discharge. ET was determined by careful selection and analysis of Landsat digital data to determine an agricultural region's land cover; ET was then used in a hydrologic water balance model. Digital image processing of Landsat-3 data discriminated major field crops and forests in Tift County, Georgia, for a water use assessment. A water balance model based on a modified Penman relationship was developed to estimate ET. The remotely-sensed data and local meteorological data were then used in a hydrologic model to predict daily WWB. The simulation was evaluated by comparing model performance with WWB measurements for a 15.5 square-kilometer instrumented agricultural watershed. (Zielinski-IPA)

WATER, ENERGY, AND ECONOMIC DEVELOPMENT TOWARDS AN INTEGRATED REGIONAL POLICY ANALYSIS SYSTEM,
Rhode Island Univ., Kingston.
R. W. Hardy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184111, Price codes: A04 in paper copy, A01 in microfiche. New England Council of Water Center Directors Completion Report, February, 1981. 51 p, 3 Fig, 1 Tab. OWRT-C-90071-G/C-00191-G(No 9412)(1).

Descriptors: *Water policy, *Water resources development, *Institutions, *Governmental interrelations, *Regional analysis, Institutional constraints, Planning, Projections, Estimated costs, Economic efficiency, Financial feasibility, Legislation, Natural resources, Political aspects, Political constraints, Analysis, Cost analysis, Governments, Constraints, Administration, Computer models, Research and Development.

The first version of the study prospectus for this project was developed in 1972. The general study thesis was that water resources development and preservation, as well as energy production and consumption, have common links in economic development; and that, thus, policy analysts could use an integrated methodological approach. It was concluded that the nature of institutions and how they function seems to require highly compartmentalized decision-making/planning, and incentives for coordination appear weak. The implications of this conclusion were explored, and potential solutions were sought. Regional policy analysis should include several principal components, one of which should be the use of a computer model or set of linked models or technical tool for regional interaction analysis, capable of tracing the path/magnitude/speed/sequence of expected water/energy/economic development interactions. Research needs have been identified. It was felt that universities are the most appropriate institutions for conducting policy-oriented regional team research. (Zielinski-IPA)

WATER, ENERGY, AND ECONOMIC DEVELOPMENT TOWARDS AN INTEGRATED REGIONAL POLICY ANALYSIS SYSTEM, SELECTED BACKGROUND ESSAYS.

Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184129, Price codes: A03 in paper copy, A01 in microfiche. New England Council of Water Center Directors Completion Report, December, 1980. Hardy, R.W., Ed. 41 p, 2 Fig, 52 Ref. OWRT-C-90071-G/C-00191-G(No 9412)(3), 14-34-0001-9412.

Descriptors: *Water policy, *Water resources development, *Governmental interrelations, *Regional analysis, *Computer models, Institutional constraints, Planning, Projections, Estimated costs, Economic efficiency, Financial feasibility, Legislation, Research and Development, Natural resources, Political aspects, Political constraints, Analysis, Cost analysis, Governments, Administration.

This report, based on a selected literature review, consists of brief background essays prepared for the project: 'Water, Energy, and Economic Development Towards an Integrated Regional Policy Analysis System'. Also included is a write-up for a preliminary systems dynamic model, used as a learning tool by members of the project research team. The model was prepared by Dartmouth College. The working papers have been published to elaborate on the thinking behind the main project report (see W81-02430) and to provide a stimulus basis for further research. The working papers have addressed (1) planning theory; (2) institutional impacts of energy systems (the problem of scale); (3) regional incidence of investment and welfare; (4) innovation in the public sector; and (5) description of a preliminary model for the study of interactions among water, energy, and economic development. (Zielinski-IPA)

A METHODOLOGY FOR ASSESSING THE REGIONAL INTER-RELATIONSHIPS OF WATER RESOURCES, ENERGY SUPPLY AND ECONOMIC DEVELOPMENT.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184145, Price codes: A11 in paper copy, A01 in microfiche. Proceedings of the Workshop, October 4-5, 1979, Boston, Massachusetts. New England Council of Water Center Directors, Water/Energy/Economic Development Project, March, 1980. 195 p. OWRT-C-90071-G/C-00191-G(No 9412)(2), 14-34-0001-9412.

Descriptors: *Research priorities, *Regional development, *New England, *Projections, *Computer models, Planning, Economic prediction, Estimated costs, Multiple-purpose projects, Constraints, Institutional constraints, Legal aspects, Administration, Government, Institutions, Political constraints, Water policy, Project planning, Economic justification, Methodology, Decision making, Forecasting, Water resources development.

This workshop was designed to fulfill in part, specific objectives of the first phase of a research program begun in May 1979 by the New England Council of Water Center Directors to develop an integrated planning method to analyze the dynamic relationship between water, energy, and economic patterns in New England. Five issue papers were presented. The first four reviewed existing methodologies for projecting water and energy demands, electrical energy supply, and economic development patterns; the fifth paper linked the concepts to establish a provisional framework for understanding the basic relationships in the energy/water/economic development system. Discussion of an enlarged view for planning methodology identified a strategy based on (1) a broader understanding of the dynamic behavior of the interrelationships, (2) a greater awareness of institutional structure and changing patterns of public decision-making in a region, and (3) improved guidelines to link (1) and (2). Reports of the three workgroups (regional development dynamics; patterns of decision/institutions; planning strategies/methodologies) are summarized. The overall workshop conclusion was that a more basic understanding of regional economy-energy-water linkages is necessary as a principal first step in planning methodology development. Needed research areas were identified and enumerated. (See W81-02433 thru W81-02437)

ANALYSIS OF SELECTED REGIONAL FORECASTS AND PROJECTIONS OF WATER DEMAND, WATER QUALITY, AND WATER SUPPLY COSTS IN NEW ENGLAND,
Thayer School of Engineering, Hanover, NH.
P. H. Kirshen.
In: A Methodology for Assessing the Regional Interrelationships of Water Resources, Energy Supply and Economic Development, Proceedings of the Workshop October 4-5, 1979, Boston, Massachusetts, p A1-A44, March, 1980. 6 Fig, 3 Tab, 17 Ref.

Descriptors: Forecasting, *Projections, *Water demand, *Water quality, Water supply, Research priorities, *New England, Analysis, Regional development, Planning, *Economic prediction, Estimated costs, Multiple-purpose projects, Constraints, Institutional constraints, Legal aspects, Governments, Administration, Water policy, Project planning, Economic justification, Methodology, Computer models, Decision making.

A research project is currently being coordinated by the New England Council of Water Center Directors to develop a basic methodology for evaluating and predicting the likely regional consequences of public policy decisions in water resources, energy, and economic development. This report is an analysis of projections for water supply (WS), water quality (WQ), and water supply costs (WSC) in New England. Fifteen studies reported over 1968-1977 in the New England area (WS, 8; WQ, 5; WSC, 2) were reviewed and summarized, including their projection methodologies and associated assumptions. A diagrammatic explanation of the qualitative relationships between water, energy, and economic development was developed (causal loop diagram), which shows how factors influence each other (to increase, decrease, or lead to equilibrium) over time. The studies reviewed in this report only partially and very incompletely consider impacts and feedbacks caused by developing a projection for one of the three interacting water/energy/economic development variables. The potential for development of improved projection methods was discussed. Improved methodology will require research to determine the significance of identified relationships for the variables, and development in conjunction with institutional constraints. (See also W81-02432)(Zielinski-IPA)
W81-02433

A SUMMARY OF ENERGY MODELS AND ENERGY DEMAND PROJECTIONS FOR NEW ENGLAND,
Massachusetts Univ., Amherst.
T. H. Stevens.
In: A Methodology for Assessing the Regional Interrelationships of Water Resources, Energy Supply and Economic Development, Proceedings of the Workshop October 4-5, 1979, Boston, Massachusetts, p B1-B30, March, 1980. 6 Tab, 28 Ref.

Descriptors: *Computer models, *Energy, *Projections, *New England, Research priorities, *Regional development, Planning, Economic prediction, Estimated costs, Multiple-purpose projects, Institutional constraints, Legal aspects, Administration, Governments, Institutions, Political constraints, *Water policy, Project planning, Economic justification, Methodology, Decision making, Forecasting, Water resources development.

The objectives of this summary were to review existing energy forecasts of the New England region; to evaluate each, regarding assumptions and methods used; and to discuss implications for the development of an improved methodology for evaluating energy-water-economic interactions in New England. Four classes of energy models were identified: (1) optimization models; (2) simulation using econometrically-fitted parameters; (3) simulation using parametric analysis; and (4) economic structure models using input-output or other macroeconomic framework. Regardless of the model used, a wide range of alternative energy forecasts are possible, depending on assumptions and public policies considered. Examples of these are given and discussed. A combination of model types may be useful to this study, but model structure mixing is cautioned against. Econometric techniques might be used for short-run analysis; programming techniques may be preferable for long-run situation evaluation. Certain decisions must be made, including, system exogenous/endogenous factors, and the emphasis needed for distributional, environmental, and other non-efficiency issues. (See also W81-02432)(Zielinski-IPA)

ELECTRIC SECTOR PLANNING MODELS,
Brookhaven National Lab., Upton, NY.
P. M. Meier.
In: A Methodology for Assessing the Regional Interrelationships of Water Resources, Energy Supply and Economic Development, Proceedings of the Workshop October 4-5, 1979, Boston, Massachusetts, p C1-C16, March, 1980. 3 Tab.

Descriptors: *Electric power, *Computer models, *Projections, *New England, Research priorities, Regional development, Planning, Economic prediction, Estimated costs, Multiple-purpose projects, Institutional constraints, Legal aspects, Administration, Governments, Insitutions, Political constraints, Project planning, Economic justification, Methodology, Decision making, Forecasting, *Water resources development.

The objective of this paper was to explore the use of electric sector planning models within the overall framework of energy, economic and water resource development planning. The perspective adopted was that of the electric sector planner; the fundamental question posed was the degree to which other sectors should be considered to model the electric sector satisfactorily. A brief review is given of electric sector models and the results of their application to New England. Key guidelines were set forth for electric sector treatment alone, followed by integration of electric sector models into a wider integrating framework that adequately considers the links to the overall energy system, and to water resource and economic development. Recommended paths to an integrated framework were: (1) adopt an integrating model, well-tested at the national scale, and simply apply it to the regional scale with appropriate data base changes; (2) adopt a model already existing for New England, and build on it; (3) use existing models for component subsectors, and design a series of linkages around the submodels to produce an integrated system having the needed breadth and flexibility. (See also W81-02432)(Zielinski-IPA)
W81-02435

AN ANALYSIS OF ASSUMPTIONS BEHIND REGIONAL ECONOMIC DEVELOPMENT PROJECTION METHODOLOGIES,
M. Howland.
In: A Methodology for Assessing the Regional Interrelationships of Water Resources, Energy Supply and Economic Development, Proceedings of the Workshop October 4-5, 1979, Boston, Massachusetts, p D1-D49, March, 1980. 3 Ref.

Descriptors: *Computer models, *Regional development, *New England, *Economic prediction, Research priorities, Planning, Estimated costs, Multiple-purpose projects, Institutional constraints, Legal aspects, Administration, Governments, Institutions, Political constraints, Water policy, Project planning, Economic justification, Methodology, Decision making, Forecasting, *Water resources development.

The most widely-used regional economic projection methodologies have been described and analyzed to determine explicit/implicit assumptions about water and energy supply and demand, either incorporated within the model or treated as external variables exogenous to the model. Analysis of the major methodologies demonstrated two sets of acute weaknesses; one inherent in the national model, the other in the method of finding equivalent projections for regions. National economic projection techniques are largely determined within the strictly economic-mathematically oriented model without considering resource limita-

tions or social preferences. Historical evidence is a function of strict economic behavior only in part; strict application of this evidence to future (especially long-term) projections represents an acute weakness. Regional projections carry the weaknesses of the national models forward, and since smaller numbers are involved, are subject to greater statistical error. It should nonetheless, be possible to construct a general strategy from these background analyses. (See also W81-2432)(Zielinski-IPA)
W81-02436

SOME ASPECTS OF INSTITUTIONAL ANALYSIS FOR WATER, ENERGY AND ECONOMIC DEVELOPMENT IN THE NEW ENGLAND REGION,
Vermont Univ., Burlington.
M. B. Lapping.
In: A Methodology for Assessing the Regional Interrelationships of Water Resources, Energy Supply and Economic Development, Proceedings of the Workshop October 4-5, 1979, Boston, Massachusetts, p E1-E27, March, 1980.

Descriptors: *Institutional constraints, Planning, *Projections, *Estimated costs, *Regional development, *New England, Multiple-purpose projects, Constraints, Legal aspects, Administration, Governments, Institutions, Political constraints, Water policy, Project planning, Long-term planning, Short-term planning, Economic justification, Methodology, Research priorities, Decision making, Forecasting.

Two sets of materials were used to document this study. The first set consists of a listing of agencies within the region currently having a decision-making role in one or more areas of concern. A State case study was cited (Maine), indicating the nature of institutional linkages and relationships existing relative to planning and regulatory functions. The second set of materials consists of three charts that address the nature of energy regulation by State regulatory commissions, and illustrate that differences exist in the New England region in three critical elements (nature of energy utilities regulated; nature of rates or price structure used by utilities; factors creating rate structures as developed by the various State regulatory commissions). There do not appear to be substantive interrelationships in a given State for comprehensive examination of water, energy, and economic development policies/issues. These problems are further exacerbated by discrete subregional (north-south; urban/rural) value conflicts within New England. (See also W81-02432)(Zielinski-IPA)
W81-02437

COST EFFECT STREAM-GAGING STRATEGIES FOR THE LOWER COLORADO RIVER BASIN: THE BLYTHE FIELD OFFICE OPERATIONS,
Geological Survey, Reston, VA. Water Resources Div.
M. E. Moss, and E. J. Gilroy.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $16.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1048, December, 1980. 112 p, 46 Fig, 3 Tab, 12 Ref.

Descriptors: *Colorado River, *Cost analysis, *Network design, *Steam gages, *Basic data collections, Decision making, Streamflow, Networks, Time series analysis, Markov processes, Optimization, *Lower Colorado River basin.

This report describes the theoretical developments and illustrates the applications of techniques that recently have been assembled to analyze the cost-effectiveness of federally funded stream-gaging activities in support of the Colorado River compact and subsequent adjudications. The cost effectiveness of 19 stream gages in terms of minimizing the sum of the variances of the errors of estimation of annual mean discharge is explored by means of a sequential-search optimization scheme. The search is conducted over a set of decision variables that describes the number of times that each gaging route is traveled in a year. A gage route is defined as the most expeditious circuit that is made from a field office to visit one or more stream gages and return to the office. The error variance is defined as a function of the frequency of visits to a gage by using optimal estimation theory. Currently a minimum of 12 visits per year is made to any gage. By changing to a six-visit minimum, the same total error variance can be attained for the 19 stations with a budget of 10% less than the current one. Other strategies are also explored. (USGS)

RESEARCH DESIGN AND MITIGATION PLAN FOR THE YELLOWHOUSE DAM AND RESERVOIR, PUEBLO OF ZUNI, NEW MEXICO,
Nickens and Associates, Montrose, CO.
S. M. Collins, and P. R. Nickens.
Report prepared for Water and Power Resources Service, Lower Colorado Regional Office, Boulder City, Nevada, March, 1980. 161 p, 1 Fig, 3 Tab, 95 Ref, 7 Append. 9-07-30-X0084.

Descriptors: *Indian reservations, *New Mexico, *Damsites, *Reservoir sites, Water resources planning, Research priorities, *Archaeology, National historic sites, Project planning, Dams, Water control, Zuni Indian Reservation.

The proposal to build a dam and reservoir at the confluence of the Rio Nutria and Rio Pescado on the Zuni Indian Reservation requires a mitigation plan to minimize the adverse effects on the archaeological sites in the area. Yellow House, a Registered National Historic Landmark, is one such site, which will be flooded periodically, and 205 other sites and 92 localities will be seriously affected. The mitigation plan comprises an outline summary of previous archaeological/historical investigation, a research design, and a recommended work plan. The research design seeks to refine chronology for Puebloan sites, establish past uses of natural resources, and reconstruct social relationships. Research questions and scientific procedures are suggested to achieve the general research goals. The work plan summarizes the sites by period, type, and impact, and the sites where each research procedure would be relevant. Thirty-six sites are recommended for habitation site studies, and 24 sites are recommended for the search for water control features or roads. Other sites are suggested for special studies to complete research procedures. (Brambley-SRC)

THE DEMAND FOR WATER TRANSPORTATION: APPLICATION OF DISCRIMINANT ANALYSIS TO COMMODITIES SHIPPED BY BARGE AND COMPETING MODES IN OHIO RIVER AND ARKANSAS RIVER AREAS,
Army Corps of Engineers, Fort Belvoir, VA.
L. G. Antle.
Research Report 80-R2, August, 1980, 153 p, 20 Fig, 19 Tab, 47 Ref, 1 Append.

Descriptors: *Transportation, *Barges, *Cost analysis, *Ohio River, *Arkansas River, Railroads, Roads, River basin development, Models, Pipelines, Pricing, Channels.

Discriminant analysis is utilized to calibrate a modal choice model from disaggregate observations of individual shipments. Transport demand functions for barge shipments are developed for coal used for energy and metallurgical markets. Barge demand functions are developed for commodities other than coal including chemicals and refined petroleum products. Data utilized in the analysis represents a total of 815 shipments totaling 145.9 million tons shipped annually for 14 major commodity groups utilizing 9 transport modes. Conventional rail and unit train modes comprised about 54% of the shipments and 33% of the annual tonnage in the sample. Barge transport accounted for 18% and 55% of the annual tonnage, with truck, pipelines and mixed modes accounting for the remainder. Demand estimates show the demand for barge transportation to be in-elastic. Relative price escalation from 2 to 5 times the values reflected in the data is required to achieve substantial decreases in the quantity shipped by barge. The impact of waterway user charges is not likely to cause significant diversion of traffic to other modes. This would allow competing modes to raise rates, reducing revenue deficiencies experienced by many rail carriers. The technological attributes of barge transportation remain as advantages for many waterways users over competing modes. (Brambley-SRC)

WATER SYSTEMS AUTOMATION AND MANAGEMENT, PART 1,
H. R. Williams.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 2-1, p 1-5.

Descriptors: *Water supply development, *Water management(Applied), *Automation, *Administration, Evaluation, Water supply, Water policy, Water measurement, Water quality standards, Training, Water users, Utilities.

Because of the importance of water in social and economic development, careful attention must be given to its management for optimum control, conservation and use. The goal is to establish the need for continual evaluation of practices, methods, procedures and policies used in managing water supplies. While operating policies will differ among water projects, the following water management objectives are applicable to all: purpose of the project; project operational policy; water supply forecasts; water measurement program; water records program; water quality standards; adequately rained operators; and public relations. Once objectives are identified, plans may be made for their implementation, evaluation of the results, and revisions may be made to correct weaknesses or meet changing conditions. (Brambley-SRC)

THE PRICING AND EVALUATION OF NATURAL RESOURCES,
Georgia Univ., Athens. Inst. of Natural Resources.
R. M. North.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-165649, Price codes: A08 in paper copy, A01 in microfiche. In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, GA, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Rpt. FWS/OBS-80/27, Nov., 1980, p 154-162. 1 Fig.

Descriptors: *Pricing, *Natural resources, *Economics, Coasts, *Wetlands, Evaluation, Economic impact.

Economics is defined as a study of any action or process which has to do with the creation of goods and services to satisfy human wants. The positive approach to economic thinking is to avoid moral, ethical, or normative judgements and to take the economic system as it is. The basis of the normative approach is to make value judgements respecting the performance of the economic system. For economic efficiency, a reasonable effective system of market pricing must be maintained. The problems in the pricing system are most noticeable in areas of natural resources and environmental concerns where markets are not well-defined. The three basic types of goods are economic goods, free goods, and public goods. An economic good is anything that has value in use or that is scarce. Free goods are those that are abundant, and therefore there is no price. Public goods are those which society values, but has no way of pricing to its individual members. Much of the nations natu-

ral resources fall into the category of public goods, or are in transition from a free good to a public good. There are five different methods of establishing the price for goods: market value to the consumer or participant; sectoral economic impacts; personal cost of participation; social value to the participant; and reservation value to potential participants. The reservation value is a measure of the willingness to reserve or maintain an opportunity to participate or enjoy a good in the future. This is the driving force behind the valuation of much of our natural resources, and things one would like to preserve for the future. (Moore-SRC)

PACKAGE PLANTS: A COST-EFFECTIVE SOLUTION TO SMALL WATER SYSTEM TREATMENT NEEDS,
Environmental Protection Agency, Cincinnati, OH. Drinking Water Research Div.
R. M. Clark, and J. M. Morand.
Journal of the American Water Works Association, Vol 73, No 1, p 24-30, January, 1981. 5 Fig, 10 Tab, 8 Ref.

Descriptors: *Water treatment facilities, *Performance, *Package plants, Water quality, Evaluation, Comparative costs, Safe Drinking Water Act, Reliability, Water purification, Municipal water, *Costs, Operating costs, Maintenance costs, Construction costs, Economies of scale, Treatment facilities, Coliforms, Hydrogen ion concentration, Turbidity, Metals, Trihalomethanes, Potable water.

Package water treatment plants consisting of prefabricated and largely preassembled clarification and filtration units are commonly used in the United States for small water supplies. A survey of 19 municipal and 17 recreational package water treatment systems produced the following performance data: pH, 6.5-8.6; coliforms, present in 3 of 31 systems; turbidity, 8 of 31 exceeding maximum federal standards; trihalomethanes, 5 of 31 exceeding 0.10 mg per liter; pesticides, none; silver, 2 systems; mercury, less than 0.001 mg per liter in several plants and 0.020 mg per liter in 1 municipal plant. Most aberrations in performance were ascribed to operator inattention or intermittent operation. Most package plants serve populations of 10,000 or less and have a capacity of 1.5 mgd or less. Comparative costs of a 1 million gallon per day conventional plant versus a package plant showed that the package plant was more economical. Construction costs for a conventional plant were $1,120,000 and annual operating and maintenance costs, $63,000; package plant, $488,000 and $40,000 respectively. (Cassar-FRC)

ENERGY IMPACT ANALYSIS IN WATER PROJECT PLANNING,
California Univ., Davis. Dept. of Land, Air and Water Resources.
R. M. Hagan, and E. B. Roberts.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 289-302, March, 1980. 1 Fig, 9 Tab.

Descriptors: *Energy costs, *Planning, *Project planning, Alternative planning, Waste water treatment, Water quality, Los Angeles, New Melones, California, Electric powerplants, Water resources development, Powerplants, Cost-benefit ratio, Economics, Water reuse.

Since the energy crisis is a relatively recent development compared with water shortages and pollution, this paper illustrates some problems in preparing and interpreting the impact of energy costs and availability on water project planning. Energy analysis should be carried out in energy units separately from the economic aspects. Total energy impact should be considered and should include items such as energy consumed in producing the electricity and energy consumed in producing steel for construction of a dam. Planning for the New Melones, California, water management project produced estimates from a maximum power production of 430 million kilowatt hours per year to a net loss of 3.9 million kilowatt hours per year. The proponents of the higher figure did not include energy costs, line losses incurred in delivery of power, and the flooding of the existing electric power plant. The opponents, who claimed the project would produce a loss in available energy, calculated costs in BTU of primary energy and benefits in BTU of delivered electricity with a benefit-cost ratio of 0.65. When the authors recalculated these figures and considered the savings produced by inactivation of the old power plant, the benefit-cost ratio increased to 2.7. If the reduction of decline in shallow wells is considered, the ratio rises to 4.1. Several other projects were evaluated using energy impact: average life and average maintenance costs for household items versus water quality, pollutants removed from waste water by three methods of treatment versus pollutants added to the environment, total energy requirements of water supply alternatives for the Los Angeles area, and total energy required for waste water reuse versus imported fresh water. DESIGN OF LENGTH OF WATER RESOURCE SIMULATION EXPERIMENTS,
CDM, Waltham, MA.
G. J. Vicens, and J. C. Schaake, Jr.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 333-350, March, 1980. 7 Fig, 9 Tab, 17 Ref.

Descriptors: *Model studies, *Water resources, *Planning, Alternative planning, Benefits, Mathematical models, Streamflow, Rio Colorado, *Argentina, Correlation analysis.

Simulation models in water resource planning should take into account the reliability of information, based on a specific run length. One procedure compares two alternatives, pair-by-pair, and produces reliability levels for various simulation lengths. Correlated samples, serially and crosswise, may be included. A second procedure, which does not include correlated samples, compares more than two alternatives. The effect of cross-correlation tended to overcome the effect of serial correlation. Serially correlated samples increased the required number of observations, and cross correlation reduced the run length. A model was applied to the Rio Colorado, Argentina, basin to determine whether 50 year or 500 year simulation would produce reliable information. Even with weighting toward different objectives, i.e., increasing of national income vs. regional income, a 50 year run was sufficient to achieve greater than 90% reliability. (Cassar-FRC)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

DECLINING BLOCK RATES CAN ENCOURAGE WATER CONSERVATION,
East Bay Municipal Utility District, Oakland, CA.
L. Sawchuk.
Journal of the American Water Works Association, Vol 73, No 1, p 13-15, January, 1981. 2 Tab, 3 Ref.

Descriptors: *Pricing, *Water conservation, *Utilities, Conservation, Water consumption, Water rates, Elasticity of demand, Industrial water, Public utilities.

Declining block rates, criticized as encourgaging waste and inefficiency, actually promote water conservation for most utilities with a diversified customer mixture. Using the price elasticity coefficients (usually -0.225 for residential users and -0.10 for commercial users), changes in consumption versus prices can be predicted and total revenues computed. The author claims that changing from a declining rate block to a single unit or inclining block pricing structure will result in increased total consumption whenever the average elasticity of demand for consumption in the higher priced blocks (low use) is larger than that of consumption in the lower priced blocks (high use). (Cassar-FRC)

MINIMIZING TREATMENT COSTS IN MULTIPLANT SETTINGS,
Duke Univ., Durham, NC. Dept. of Civil Engineering.
J. J. Peirce, E. F. Joeres, and M. H. David.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 427-438, July, 1980. 9 Fig, 1 Tab, 4 Ref.

Descriptors: *Cost sharing, *Joint costs, *Waste water treatment, Comprehensive planning, Water pollution control, Lake Michigan, Wisconsin, Optimization, Planning, Phosphorus compounds, Operating costs, Municipal wastes, Coordination, Cost analysis, Efficiencies, Cost allocation.

Methods for determining least cost operating schedules for groups of waste water facilities are developed and compared. These are applicable to cooperative operations where municipalities join together to remove pollutants most efficiently. A sample situation involves 3 of the 53 Wisconsin towns ordered to remove 85% of the phosphorus from water discharged into Lake Michigan. Whereas present methods use total cost curves in linear or nonlinear programming, the method described in this paper, usable for up to 20 towns, develops marginal cost curves (the cost of removing each additional unit of phosphorus) and average cost curves (represents the average cost for all units of phosphorus being removed). The equal average incremental cost method, a variation of the above, is more useful if total cost relationships are not continuous. Up to 10 facilities may be handled. For a large number of units, dynamic programming is necessary. (Cassar-FRC)

6D. Water Demand

NEW YORK'S WATER SUPPLY DILEMMA,
Metcalf and Eddy, Inc., New York.
G. P. Fulton.
Public Works, Vol 112, No 2, p 55-59, February, 1981. 2 Fig, 4 Tab.

Descriptors: *New York, *Water supply development, *Safe yield, Skimming, Droughts, Connecticut, New Jersey, Delaware River, Hudson River, Water supply, Water consumption, Water resources development, Water management(Applied), Low-flow augmentation, Impoundments, Reservoirs, Overflow, Municipal water, Planning.

Although water consumption in the metropolitan New York area decreased by 15% during the severe drought of the 1960's, the return of normal rainfall caused a quick return to less conservative water use habits. Daily per capita consumption has increased 29.4% in N.Y. City since 1968; 5.8 to 20.8% in the counties surrounding the city. In spite of these increases, no significant additions have been made to the available water supply. If a severe drought occurs, the greater N.Y. area would experience a 330 mgd deficit. Short term projects (3 to 5 years) were proposed to alleviate the deficit until completion of proposed major water supply projects divert and store excess runoff in impoundment basins, specifically the Hudson River and Chelsea pumping station, Beaver Kill, Round Valley, and the Pompton-Passaic Rivers confluence. Possible long term projects (12 to 20 years) would all use water from the main stems of the present sources, the Delaware and Hudson Rivers, and include the Tocks Island Reservoir on the Delaware, the Gooley Reservoir

to store water taken near Poughkeepsie, and high flow skimming of the Hudson River. (Cassar-FRC)

WATER QUALITY LEGAL ISSUES AND LAND USE IN A SHARED ESTUARY,
Rhode Island Univ., Kingston.
J. J. Kupa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185324, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1980), 12 p, 2 Fig, 1 Tab. OWRT-A-069-RI(1), 14-34-0001-9042.

Descriptors: *Estuaries, *Water quality, Water pollution, *Water rights, *Legal aspects, *Land use, *Urbanization, *Interstate rivers, Bodies of water, Bays, Aquatic habitats, Estuarine environment, Rivers, Water quality control, Biochemical oxygen demand, Connecticut, Rhode Island, Boundary disputes, Water law, Land development, Drainage, Land resources, Interstate commissions, Watershed management, *Little Narragansett Bay.

This research studied the relationship between alternative land use plans for an estuary (Little Narragansett Bay) shared by two States (Connecticut and Rhode Island), and their relative effects on estuarine water quality. The study area consisted of watersheds of Westerly, Rhode Island and Stonington, Connecticut, which border the Pawcatuck River and the estuary. Land use in these has a definite impact on water quality. At present, urban runoff from the local watersheds of both towns provides a significant BOD5 source in the estuary. Computer modeling predicts that BOD5 from urban runoff with as little as 25% future land development will exceed the BOD5 contribution of the sewage treatment plants on the estuary. The findings of this study demonstrate the need for cooperative land user planning across State borders to reduce the water quality deterioration potential for common estuaries. Legal and innovative institutional mechanisms were developed to meet the challenge of this cooperative effort. Recommendations for future land use development were proposed. (Zielinski-IPA)

NEW DIRECTIONS IN WATER POLICY, SEMINAR CONDUCTED BY WATER RESOURCES RESEARCH INSTITUTE, OREGON STATE UNIVERSITY, FALL QUARTER 1979.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185340, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute, Oregon State Univ., Corvallis. Report SEMIN WR 027-80, January, 1980. 41 p, 2 Fig, 4 Tab, 1 Append. OWRT-A-999-ORE(27).

Descriptors: *Water policy, *Oregon, *Public rights, *Legal aspects, *Planning, Institutions, Governments, State jurisdiction, Water law, Future planning(Projected), Decision making, Water demand, Constitutional law, Water resources development, Institutional constraints, Water, Competing uses, Water resources, Electric power, Interstate.

This seminar was held to examine some of the Oregon factors involved in a broad set of water policy initiatives announced by President Carter on June 1978 to bring about 'reforms' in: Federal-State cooperation, water planning processes, water conservation, and increased environmental sensitivity. Five papers were presented: Federal/State water policy issues; water and public control; policies and aquatic ecosystems; water resources and land use planning; and energy and water policy in the Columbia River. Emerging water policy issues involve coordination between land use, water quality and quantity planning, increasing community demands, municipal and agricultural supplies, hydroelectric power development, and Oregon's role in water resource development. Contrasting approaches were noted to allocating water to minimum flows in Colorado and Montana, the former using public participation in the market rather than public regulation of the market. Policy and administrative mechanisms of the Oregon Department of Fish and Wildlife to assure adequate water supply for State fish/wildlife resources was also delineated. It was concluded that future developments of the Columbia River lie not on the River, but on its tributaries. (Zielinski-IPA)

EFFECTIVE WASTE WATER MANAGEMENT PLANNING,
California Univ., Davis. Dept. of Civil Engineering.
R. F. Barror, and G. Tchobanoglous.
Public Works, Vol 111, No 8, p 76-80, August, 1980. 2 Fig, 15 Ref.

Descriptors: *Federal project policy, Management, *Grants, Government finance, Rural areas, Planning, Municipalities, *Waste water management.

Waste water management planning is examined with respect to the federal regulatory process, the grant process, and the unique considerations of small communities. Small communities tend to be under-managed, and municipal services requiring capital investments do not always have the financial support they need. Planning for water pollution control can be improved by making the water treatment system as flexible as possible. The project should not necessitate a long-term commitment for non-renewable resources, and the facility should make use of unemployed unskilled labor and available land. Treatment facilities may need to expand in the future, or reduction of waste water flow through conservation may be all that is needed to upgrade the plant. Federal involvement primarily pertains to the EPA construction grants. Revamping the EPA Construction Grants Program is needed to emphasize not only innovative technologies but also innovative planning and management concepts. Economic and other incentives are needed at the local and regional levels to encourage effective waste water management planning. (Small-FRC)

REAGAN TEAM'S BLUEPRINT TO EPA.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 16-20, January, 1981.

Descriptors: *Environmental Protection Agency, *Heritage Foundation, *Water quality, *Water pollution control, *Regulations, Water policy, Legal aspects, Legislation, Administration, Governments, Standards, Waste water treatment.

The 3000 page Heritage Foundation report, 'Mandate for Leadership: Policy Management in a Conservative Administration,' concerns 20 areas of study, one of which is the EPA. Some of the criticisms of EPA's water quality program are as follows: policy level personnel lack proper training and experience, federal agencies distribute funds according to formula and numbers, standards for quality in some cases are lower than natural waters, carcinogen standards are very low, federal contact with industries and cities is in an adversary role rather than in a leadership or assistance role, model calculations are not calibrated or verified for the particular water body, adequate water quality monitoring is not required, secondary treatment has been poorly defined, EPA regulations are unintelligible and contradictory, the zero discharge goal is impossible and inflexible, and decisions are frequently based on insufficient data. A list of recommendations to alleviate the above problems is given. Emphasis is on good personnel, less orientation toward perfection, meeting reasonable deadlines, more power to the states, focus on critical areas, review of standards, legislation to protect groundwater quality, and transfer of environmental control programs to other, more experienced federal agencies. (Cassar-FRC)

ICPRB AND WASHINGTON METRO WATER MANAGEMENT,
Interstate Commission on the Potomac River Basin, Rockville, MD.
D. P. Sheer, and P. W. Eastman.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 303-317, March, 1980. 4 Fig, 1 Tab, 15 Ref.

Descriptors: *Planning, *Water management(Applied), *District of Columbia, *Regional development, Waste water treatment, Water supply, Potomac River, Governments, Sewer expansion simulation, Risks, Model studies, Water quality, Water resources, Water policy, Interstate rivers, Interstate commissions, Interstate Commission on the Potomac River Basin.

Responsibilities for water supply and waste water treatment in the Washington, DC., area are divided among many local, state, and federal agencies. The Interstate Commission on the Potomac River Basin (ICPRB) is cited as an example of effective regional coordination in both water quality and water supply management. The ICPRB mediates disputes among the jurisdictions, is developing a sewer expansion simulation to aid in planning, and provides information and technical assistance. Two techniques for estimating risk and the impact of changing operating policies on risk were developed and implemented. Risk analysis is a simulation of reservoir operation using historical streamflows. This was first used to study the Occoquan Reservoir in September 1977. Although water supply and waste treatment organization remains complex and fragmented in this area, increasing regionalization will be seen; for example, interconnections between utilities and coordinate water use during droughts. The low flow allocation agreement for the Potomac River made a significant contribution to better coordination in planning. (Cassar-FRC)

6G. Ecologic Impact Of Water Development

COASTAL HABITAT DEVELOPMENT IN THE DREDGED MATERIAL RESEARCH PROGRAM,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
H. K. Smith.
In: Rehabilitation and Creation of Selected Coastal Habitats: Proceedings of a Workshop, Sapelo Island, Georgia, 16-20 May, 1976. Fish and Wildlife Service, Biological Services Program, Washington, DC., Report FWS/OBS-80/27, November, 1980, p 117-125. 1 Fig, 1 Tab.

Descriptors: *Habitats, *Dredging, *Disposal, *March management, Wetlands, Aquatic habitats,

Land management, Water quality, Dewatering, Dikes, Engineering structures, Islands, Dredging, Channel improvement, Coasts, Spoil banks.

Annual maintenance dredging volumes for Army Corps of Engineers projects exceed 214,100,000 cubic m, with new work producing approximately 61,200,000 cubic m. The large volumes of dredged material often present extraordinary disposal problems. The Dredged Material Research Program has been divided into 4 project areas. The Environmental Impacts and Criteria Development Project is the focal point for research about the effects on water quality and aquatic organisms of both land and open-water disposal as well as land containment of dredged material. The Disposal Operations Project is primarily concerned with improving the efficiency of dredged material disposal, including dike design and improvement of dewatering techniques, landscaping, silt curtain performance, and treatment of contaminated dredged material. The basic philosophy of the Productive Uses Project is to develop new or innovative disposal methods, primarily on land, to provide disposal alternatives which derive maximum value from the resource potential of dredged material. The Habitat Development Project is divided into five tasks: the effects of dredged material disposal on marsh and terrestrial habitat, marsh development, terrestrial habitat development, aquatic habitat development, and island habitat development. Habitat development using dredged material offers an alternative disposal method that is often feasible from a biological, engineering, and economic standpoint. Careful implementation of this alternative could significantly increase the extent of wetland resources in parts of the United States. (Moore-SRC)

Descriptors: *Computer programs, *Network design, *Regression analysis, *Data collections, Probability, Estimating, Streamflow, Flow characteristics, Ungaged sites, *Bayesian analysis, Model errors.

The computer program MODLVALU enables the designer of a hydrologic-data network to apply the Network Analysis for Regional Information (NARI) technique of hydrologic network design based upon a regional regression analysis. The input to MODLVALU consists of (1) the observed standard error of estimate of the regional regression for either the mean, the standard deviation, the 2-yr, 10-yr, 50-yr or 100-yr event, (2) a probabilistic description of the design region's hydrology in terms of joint prior probabilities of the coefficient of variation and cross-correlation coefficient and (3) the level of data availability - the number of measurement sites and harmonic mean record length - associated with the data used in the regional regression. The output of MODLVALU consists of a family of probability distributions of the true standard error of estimate of the regional regression equation. The true standard error of estimate is a measure of the accuracy of using the regression equation to estimate the streamflow characteristic at ungaged sites in the design region. This family of distributions is indexed by the levels of data availability chosen for consideration by the network designer. (USGS)

MODIFIED ROTARY SHAKER PLATFORM,
Missouri Univ., Kansas City. Dept. of Biology.
D. H. Stern, and M. S. Stern.
The Progressive Fish-Culturist, Vol 42, No 3, p 188-189, July, 1980. 1 Fig, 2 Ref. OWRT-A-099-MO(3).

Descriptors: *Cultures, Bacteria, Water quality, *Laboratory equipment, *Design criteria, *Laboratory tests, Microorganisms, Bioindicators, Aquatic life, Aquatic microorganisms, Aquatic bacteria, Aquatic microbiology, Water analysis, Water pollution, Aquatic environment, Ecology, Microbiology, Environment, Analytical techniques, Assay, Laboratories, Testing, Laboratory flasks, Mixing equipment.

An earlier rotary shaker platform design to hold 500 mL Erlenmeyer flasks had been reported for culturing Selenastrum capricornutum. Based on a recent study by the authors, the shaker platform was modified to use 125 mL, 250 mL, or 500 mL flasks. This modification can accommodate up to 55 flasks in any combination of sizes. The platform measures 22.5 by 48 inches, and easily fits into a reach-in environmental chamber with the shaker tachometer exposed. The platform is used without inserts for 500 mL flasks, or with inserts made from 1.27 cm thick sheets of rigid white Styrofoam. Characteristics of the platform have been delineated. The shaker system has been in continuous use for more than a year without damage to the platforms or power units. The platform with inserts increases power unit capacity over that of equipped with a stock platform, while providing flask size flexibility and reducing platform cost. Further, inserts broken periodically still remain rigidly in place and can continue to be used. (Zielinski-IPA)
W81-02442

SCINTILLATION DETECTORS IN GAMMA SPECTRAL LOGGING: GEOMETRY, ABSORPTION AND CALIBRATION,
Geological Survey, Denver, CO. Water Resources Div.
U. Schimschal.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-688 (WRI), 1980. 29 p, 8 Fig, 10 Ref.

Descriptors: *Borehole geophysics, *Calibrations, *Analytical techniques, *Mathematical models, Instrumentation, Gamma rays, Logging(Recording), Absorption, Radiation, Evaluation, *Gamma spectral logging, Scintillation crystal, Geometric effects.

The theory for the evaluation of the effects of geometry in gamma ray absorption is developed for cylindrical scintillation detectors as applicable to borehole gamma spectrometry. The results of a laboratory experiment are shown for comparison. A calibration procedure to determine detector efficiency is given for application to borehole probes. It is shown that the response of a crystal can be separated in terms of geometric effects and instrumentation effects. It is also shown that approximating crystal detectors with point detectors in mathematical theory is grossly oversimplified. (USGS)
W81-02460

CALIBRATION AND TESTING OF SELECTED PORTABLE FLOWMETERS FOR USE ON LARGE IRRIGATION SYSTEMS,
Geological Survey, Denver, CO. Water Resources Div.
R. R. Luckey, F. J. Heimes, and N. G. Gaggiani.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121345, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-72, 1980. 21 p, 9 Fig, 1 Tab, 1 Ref.

Descriptors: *Calibrations, *Testing, *Flowmeters, *Irrigation systems, Flow measurement, Discharge measurement, Pipe flow, Instrumentation, High Plains region, Gated-pipe meter, Doppler meter, Transient-time meter.

Existing methods for measuring discharge of irrigation systems in the High Plains region are not suitable to provide the pumpage data required by the High Plains Regional Aquifer System Analysis. Three portable flowmeters which might be suitable for obtaining fast and accurate discharge measurements on large irrigation systems were tested. A propeller type gaged-pipe meter, a Doppler meter, and a transient-time meter were tested under both laboratory and field conditions during 1979. The gated-pipe meter was found to be difficult to use and sensitive to particulate matter in the fluid. The Doppler meter, while easy to use, would not function on steel pipe 6 inches or larger in diameter, or on aluminum pipe larger than 8 inches in diameter. The transient-time meter was more difficult to use than the other two meters; however, this instrument provided a high degree of accuracy and reliability under a variety of conditions. Of the three meters tested, only the transient-time meter was found to be suitable for providing reliable discharge measurements on the variety of irrigation system used in the High Plains region. THERMAL ANALYSIS OF THE ISCO 1680 PORTABLE WASTE WATER SAMPLER,
Environmental Monitoring and Support Lab., Cincinnati, OH.
P. C. L. Lin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-222425, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/4-80-033, June, 1980. 46 p, 13 Fig, 5 Ref.

Descriptors: *Sample preservation, *Waste water, *Mathematical models, Thermal properties, Water sampling, Model studies, Automation, Sampling.

The heat transfer characteristics of an automatic waste water sampler were investigated to provide

a mathematical model with which manufacturers can design a portable sampler capable of preserving samples under certain extreme environmental conditions using ice. A mathematical model was developed to simulate the operation of the ISCO 1690 automatic waste water sampler. Data obtained during operation of the ISCO sampler cooling system under varying conditions indicated that the accuracy of the mathematical model was within plus or minus 2 degrees C. The theoretical sample temperature history was in phase with that of the corresponding test sample. The sampler insulation is found to be insufficient, and the cooling rate is slow. Based upon the mathematical model, two prototype redesigns of the sampler cooling system are proposed. The first new design would require 13.6 kg of ice to lower the temperature of 24 500-ml samples to about 4 degrees C at a cycle time of 1 hour, with an environment and initial sample temperature of 30 degrees C during a 24 hour period. The second design would require 9.6 kg of ice to keep the same amount of sample to about 4 degrees C at an environmental temperature of 35 degrees C. This project verified the feasibility of using mathematical models for the development of specifications for a sampler cooling system. (Moore-SRC)

WATER SYSTEMS AUTOMATION AND MANAGEMENT, PART 4,
L. A. Brower.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 2-4, p 1-8.

Descriptors: *Computers, *Data processing, *Irrigation systems, *Irrigation districts, Design data, Automation, Irrigation engineering, Remote control, Electronic equipment, Decision making, Management, Cost analysis.

There are many names given to the type of computer best suited for the requirements of an irrigation district, including minicomputer, microcomputer, small business computer, personal home computer, and intelligent terminal. These minicomputers are usually small in size, and do not require a special environment. Generally, a minicomputer consists of a keyboard similar to a typewriter but with a few more special keys, a cathode ray tube, a data storage device using tape cassettes or diskettes, and a printer. The selection of a small or minicomputer depends on the needs and funds of a particular district, and the possibility of sharing time with another district. Computers may be used for routine record keeping including personnel records, scheduling of irrigation based on input from individual farmers, and inventory system equipment service records, aid in solving design problems and calculations for engineering staff, and in remote control and automation of the system. Steps in the process of choosing a minicomputer are presented to help staff to decide what is needed and how to make the important decisions. A glossary of computer terminology is presented. COMPUTER-BASED MONITORING FOR AVONMOUTH STW.
Water Services, Vol 84, No 1017, p 669-670, November, 1980. 2 Fig.

Descriptors: *Monitoring, *Sewage treatment, *Computer programs, Instrumentation, Data collection, Control systems, Waste treatment.

The computer based monitoring system employed at Avonmouth Sewage Treatment Works is described. Sludge produced at the treatment plant is held in digesters, and the methane produced provides power for the on-site generating station. The generating station provides enough electricity to run the works, the inlet pumping stations and a County Council incinerator. The monitoring system controls the general plant functions and regulates the methane/diesel fuel mix in the generators. The remote units collect data from seven dual-fuel engines and associated alternators, pumps, gas compressors, gas supply, switchgear and the digestion plant, and monitor other points of interest. The computer concept, called dMACS (distributed monitoring and control system) is linked to a microcomputer. When the system is fully completed it will provide all relevant and current information about the engines in the control room, activate automatic alarms to signal the need for any remedial steps, automatically shut down the dual-fuel engines in the event a serious fault develops, record events and conditions leading to a major fault, provide a single operations control panel to initiate all plant functions, and form in the long run the basis for information storage and retrieval on the whole works. (Baker-FRC)

THE PERFECT TELEMETRY MIX,
D. Barclay.
Water Services, Vol 84, No 1017, p 661-662, November, 1980. 1 Fig.

Descriptors: *Telemetry, *Instrumentation, *Monitoring, Data collection, Data transmission, Control systems, *Flood protection, Warning systems, Telephone.

An unusual mix of telemetry media is described which uses verbal and digital systems with data transmitted over private telephone wires (PW) and the public telephone network (PSTN). This provides a cost effective network of data transfer suited to the needs of each of the various locations in a complex river system, and of the different parameters monitored. Early warning of flood build-up at the headwaters of the Lea and its tributaries is received from another PSTN telemetry system called Radie. The automatic device calls several telephone numbers in succession until it gets an answer, at which point it relays a prerecorded message to the engineer on duty concerning a specific water level that is approaching a danger point. Telemetry via the PSTN has the advantage of being extremely low cost and easy to install. (Baker-FRC)

TELEMETRY SYSTEM AT GRAFHAM WATER SCHEME.
Water Services, Vol 84, No 1017, p 670, 673, 674, November, 1980. 2 Fig.

Descriptors: *Monitoring, *Telemetry, Control systems, Instrumentation, *Data transmission.

The Grafham Water Scheme, part of the Anglian Water Authority, is described. The Scheme can supply up to 227,300 cubic meters/day of treated water to the Bedford and Northampton Divisions and the Lee Valley Water Company. Water originates from the River Ouse. The telemetry system at the control center enables the operator to monitor the entire storage, treatment and distribution network. A flow diagram is pictured which shows the hydraulic arrangement within the monitoring area. The monitor concept allows precise control and simple adjustment of proble and sample temperatures, separate addition of EDTA before any other reagents, and automatic checking and self-standardization at two concentrations at preset time intervals. The monitor is suitable for use in river, sewage works effluent and many industrial applications. It can be used alone or in concert with a large monitoring scheme. The new range of ion selective monitors being developed will find application in various situations, including monitoring ammonia in coke oven effluents, chloride infiltration into boreholes, and cyanide in plating works effluent. (Baker-FRC)

POINT-VELOCITY DISCHARGE MEASUREMENT METHOD FOR SEWERS,
Auburn Univ., AL. Dept. of Civil Engineering.
A. D. Parr, J. F. Judkins, Jr., and T. E. Jones.
Journal of the Water Pollution Control Federation, Vol 53, No 1, p 113-118, January, 1981. 3 Fig, 2 Tab, 9 Ref.

Descriptors: *Flow measurement, *Manning's equation, *Channel flow, *Sewers, Discharge measurement, Point-velocity discharge, Equations, Discharge(Water), Pipe flow, Open channel flow, Measurement, Non-uniform flow.

Flow in a partially full sewer was monitored using the point-velocity discharge method. This method is accurate and economical. Measurements of depth and velocity at a single location on the vertical centerline of the pipe were used in an equation describing fully turbulent open channel flow in circular pipes. A family of empirical velocity distribution curves dependent on relative depth of flow were developed and combined with Manning's equation to produce the equation. A second formula may be used to calculate discharge in a full-flowing sewer. (Cassar-FRC)

ANALYSIS AND DISSEMINATION OF WATER QUALITY AND WATER QUANTITY DATA,
South Dakota State Univ., Brookings. Water Resources Inst.
J. L. Wiersma, C. G. Carlson, A. R. Bender, and J. H. Bischoff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-185597, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, February, 1981. 48 p, 4 Fig, 3 Tab, 7 Ref. OWRT-A-065-SDAK(1), 14-34-0001-7088.

Descriptors: *Hydrologic data, *Water quality, Water needs, *Water resources, Data collections, *Computer programs, *Information retrieval, Water measurement, Water requirements, Basic data collections, Data storage and retrieval, Data transmission, Information exchange, Measurement, Networks, Monitoring, Computer models, Programming languages, Analysis, Sampling, Surveys.

It was the purpose of this project to develop computer programs for the dissemination of available data and research results in a form useful to the general public (including political decision-makers, planners, producers of goods, and even those who represent technical areas in disciplines not closely allied with the immediate subject field). Particular emphasis was placed on fulfilling needs of producers of goods and decision makers. The computer programs presented in this report are part of a spontaneous process that grows with the researcher's needs. These programs may be modified or integrated, depending on developing needs, and can provide the basis for new ideas or continuing research. To illustrate, a program developed for the Conservation Commission has led to a more critical appraisal of present monitoring programs; Project B-053 represents a continuation of work in the soil-water compatability area. The software programs presented in this report were written for use on a commercial programmable calculator having peripherals and printer/plotter capability. The programming language is HPL. (Zielinski-IPA)

MAPS SHOWING GROUNDWATER CONDITIONS IN THE LOWER SAN PEDRO BASIN AREA, PINAL, COCHISE, PIMA, AND GRAHAM COUNTIES, ARIZONA--1979,
Geological Survey, Tuscon, AZ. Water Resources Div.
S. C. Jones.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $7.00 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-954 (WRI), July, 1980. 10 Ref, 2 Sheets.

Descriptors: *Maps, *Groundwater, *Water wells, *Water levels, *Water quality, Specific conductivity, Fluorides, Aquifers, Hydrographs, Water level fluctuations, Pumping, Irrigation, Water yield, *Arizona, Lower San Pedro basin area(AZ), Pinal County(AZ), Cochise County(AZ), Pima County(AZ), Graham County(AZ).

The lower San Pedro basin area includes about 1,550 square miles in southeastern Arizona. The area depends almost entirely on groundwater for its water supplies. In 1978 the estimated groundwater pumpage was 55,000 acre-feet, 30,000 acre-feet of which was used for irrigation. Withdrawal of groundwater has had little effect on groundwater levels in the area. Information shown on the maps includes depth to water, altitude of the water level, spring discharge, chemical quality of the groundwater, and irrigated area. Hydrographs of the water level in selected wells and a table of historical pumpage also are included. Scale 1:125,000. (USGS)

HYDROLOGY AND CHEMICAL QUALITY OF GROUNDWATER IN CROWLEY COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
D. Cain, B. J. Ryan, and P. J. Emmons.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $6.25 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-681 (WRI), 1980. 22 Ref, 2 Sheets.

Descriptors: *Groundwater, *Water quality, *Hydrogeology, *Aquifers, *Colorado, Aquifer characteristics, Alluvium, Water wells, Water yield, Dissolved solids, Specific conductivity, Chemical analysis, *Arkansas River(CO), Crowley County(CO).

Significant quantities of groundwater can be obtained from several alluvial water-table aquifers possibly from two deep confined sandstone aquifers in Crowley County, Colo. The major water-table aquifer is the alluvium along the Arkansas River valley where well yields may be as much as 2,000 gallons per minute. Minor alluvial aquifers with well yields ranging from 5 to 200 gallons per minute occur in the drainage basins of Horse Creek, Bob Creek, and Sand Arroyo, and in alluvium underlying dune sand in the western part of the county. The Dakota Sandstone and the underlying Cheyenne Sandstone are the confined aquifers. The depth to the top of the Dakota Sandstone ranges from 700 to 3,600 feet below land surface. These aquifers are currently undeveloped but well yields may be as much as 275 gallons per minute. The chemical quality of water in the aquifers varies widely with dissolved solids ranging from about 400 to 8,000 milligrams per liter. On the basis of 35 analyses of water samples, only 2 samples met drinking-water standards for all constituents determined. In most instances, the water is suitable for agricultural uses. (USGS)

ALTITUDE OF THE WATER TABLE IN THE ALLUVIAL AND WILCOX AQUIFERS IN THE VICINITY OF RICHLAND AND TEHUACANA CREEKS AND THE TRINITY RIVER, TEXAS, DECEMBER 1979,
Geological Survey, Austin, TX. Water Resources Div.
S. Garza.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $1.00 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-1007, March, 1980. 1 Sheet.

Descriptors: *Maps, *Groundwater, *Aquifers, *Water table, *Texas, Water levels, Water wells, Contours, Richland Creek(TX), Tehuacana Creek(TX), *Trinity River(TX).

This map shows the altitude of the water table in the alluvial and Wilcox aquifers in the vicinity of Richland and Tehuacana Creeks and the Trinity River, Tex., in December 1979. The water-table contours were constructed on the basis of water-level control derived from an inventory of shallow wells in the area, topographic maps, and field locations of numerous small springs and seeps. WATER-LEVEL CONTOUR AND SALT-FRONT MAP, HIALEAH-MIAMI SPRINGS WELL FIELD AREA, DADE COUNTY, FLORIDA, OCTOBER 13, 1978,
Geological Survey, Miami, FL. Water Resources Div.
L. J. Swayze.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $2.50 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-8, 1980. 1 Sheet.

Descriptors: *Maps, *Water table aquifers, *Water wells, *Water levels, *Florida, Drawdown, Salinity, Chlorides, *Dade County(FL), Well fields.

Water-level measurements of the shallow water-table aquifer were made around the Hialeah-Miami Springs well field in Dade County, Fla., on October 13, 1978. These measurements are generally made in October and May of each year to provide cooperators with a picture of the cone of depression of the well field. The cone of depression is also correlated with the 1000 milligrams per liter isochlor at the base of the aquifer. (USGS)

MAPS SHOWING GROUNDWATER CONDITIONS IN THE UPPER SAN PEDRO BASIN AREA, PIMA, SANTA CRUZ, AND COCHISE COUNTIES, ARIZONA--1978,
Geological Survey, Tucson, AZ. Water Resources Div.
A. D. Konieczki.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $7.00 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-1192 (WRI), October, 1980. 13 Ref, 2 Sheets.

Descriptors: *Maps, *Groundwater, *Irrigation wells, Water wells, *Water levels, Water quality, Specific conductivity, Fluorides, Hydrographs, *Arizona, *Upper San Pedro basin area(AZ), Pima County(AZ), Santa Cruz County(AZ), Cochise County(AZ).

The upper San Pedro basin area includes about 1,800 square miles in southeastern Arizona. The main use of groundwater is for irrigation. During 1966-77, about 481,000 acre-feet of groundwater was withdrawn. Except near Sierra Vista and Fort Huachuca, the groundwater withdrawals have had little effect on water levels. Information shown on the maps includes altitude of the water level, depth to water, depth of well, hydrographs of the water level in selected wells, irrigated area, and specific conductance and fluoride concentration in the water. A table of pumpage also is included. (USGS)

WATER QUALITY DATA FOR AQUIFERS, STREAMS, AND LAKES IN THE VICINITY OF KEECHI, MOUNT SYLVAN, OAKWOOD, AND PALESTINE SALT DOMES, NORTHEAST TEXAS SALT-DOME BASIN,
Geological Survey, Austin, TX. Water Resources Div.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $13.00 in paper copy, $6.00 in microfiche. Geological Survey Open-File Report 80-2037, November, 1980. 93 p, 6 Fig, 5 Tab, 5 Ref. Carr, J. E., Halasz, S. J., and Liscum, F., Compilers.

Descriptors: *Water quality, *Aquifers, *Streams, *Lakes, *Texas, Groundwater, Surface waters, Data collections, Sites, Streamflow, Flow measurement, Chemical analysis, Water analysis, *Northeast Texas, Salt domes.

This report contains water-quality data for aquifers, streams, and lakes in the vicinity of Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes in the northeast Texas salt-dome basin. Water-quality data were compiled for aquifers in the Wilcox Group, the Carrizo Sand, and the Queen City Sand. The data include analyses for dissolved solids, pH, temperature, hardness, calcium, magnesium, sodium, bicarbonate, chloride, and sulfate. Water-quality and streamflow data were obtained from 63 surface-water sites in the vicinity of the domes. These data include water discharge, specific conductance, pH, water temperature, and dissolved oxygen. Samples were collected at selected sites for analysis of principal and selected minor dissolved constituents. (USGS)
W81-02463

WATER RESOURCES DATA FOR NEW HAMPSHIRE AND VERMONT, WATER YEAR 1979.
Geological Survey, Boston, MA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-159592, Price codes: A09 in paper copy, A01 in microfiche. Geological Survey Water-Data Report NH-VT-79-1, December, 1980. 176 p, 3 Fig, 1 Tab.

Descriptors: *New Hampshire, *Vermont, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1979 water year for New Hampshire and Vermont consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 78 gaging stations, stage records for 3 lakes, monthend contents for 26 lakes and reservoirs, water-quality data for 9 gaging stations, and water levels for 40 observation wells. Also included are data for 18 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. A few pertinent stations (not included above) in bordering States and Province of Quebec are also included in this report. These data represent that portion of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in New Hampshire and Vermont. (USGS)
W81-02467

WATER RESOURCES DATA FOR MISSISSIPPI, WATER YEAR 1979.
Geological Survey, Jackson, MS. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-176331, Price codes: A19 in paper copy, A01 in microfiche. Geological Survey Water-Data Report MS-79-1, February, 1981. 438 p, 5 Fig.

Descriptors: *Mississippi, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1979 water year for Mississippi consist of records of stage and discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels of wells. This report contains discharge records for 80 gaging stations, stage records for 17 of these gaging stations, stage only for

3 gaging stations, contents for 4 lakes, water quality for 25 gaging stations and 162 wells, and water levels for 360 observation wells. Also included are data for 94 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Mississippi. (USGS)

WATER RESOURCES DATA FOR LOUISIANA, WATER YEAR 1980--VOLUME 1. CENTRAL AND NORTHERN LOUISIANA.
Geological Survey, Baton Rouge, LA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-171621, Price codes: A23 in paper copy, A01 in microfiche. Geological Survey Water-Data Report LA-80-1, December, 1980. 526 p, 7 Fig.

Descriptors: *Louisiana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Central and northern Louisiana.

Water resources data for the 1980 water year for Louisiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of groundwater. This report, in three volumes, contains records for water discharge at 75 gaging stations (including stage for 71 of these stations); stage only for 38 gaging stations and 11 lakes; contents for 1 reservoir; water quality for 124 surface-water stations (including 34 gaging stations, 107 miscellaneous sites, and 15 lakes), and 268 wells; and water levels for 506 observation wells. Also included are data for 271 crest-stage and flood-profile partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States are also included in this report. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal Agencies in Louisiana. (USGS)

WATER RESOURCES DATA FOR CALIFORNIA, WATER YEAR 1979--VOLUME 4. NORTHERN CENTRAL VALLEY BASINS AND THE GREAT BASIN FROM HONEY LAKE BASIN TO OREGON STATE LINE.
Geological Survey, Menlo Park, CA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163966, Price codes: A22 in paper copy, A01 in microfiche. Geological Survey Water Data Report CA-79-4, January, 1981. 505 p, 12 Fig.

Descriptors: *California, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Northern central valley basins, Honey Lake basin(CA), *Sacramento River basin(CA).

Volume 4 of the water resources data for the 1979 water year for California consists of records of stage, discharge, and water quality of streams; stage, contents, and water quality in lakes and reservoirs; and water levels in wells. This report contains discharge records for 204 gaging stations, stage and contents for 34 lakes and reservoirs, precipitation data for 2 stations, water quality for 81 stations, water levels for 33 observation wells, and water quality for 15 wells. Also included are 16 crest-stage partial-record stations, 9 low-flow partial-record stations, and 4 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as special investigations. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in California. (USGS)

A COMPILATION OF GROUNDWATER QUALITY DATA FOR KENTUCKY.
Geological Survey, Louisville, KY. Water Resources Div.
Geological Survey Open-File Report 80-685, May, 1980. 963 p, 1 Fig, 8 Tab, 16 Ref. Faust, R. J., Banfield, G. R., and Willinger, G. A., compilers.

Descriptors: *Groundwater, *Water quality, *Chemical analysis, *Hydrologic data, *Kentucky, Analytical techniques, Geology, Water properties, Water utilization.

This report provides most of the data in the files of the U.S. Geological Survey on the quality of groundwater in Kentucky. All analyses through 1979 are included except for some special purpose repetitive analyses and some with a very limited number of constituents. County location maps are included with the analyses. These include location, distribution, and density of sampling sites in each county. Most of the data in this report resulted from cooperative studies made with the Kentucky Geological Survey and with other Federal, State, and local agencies. (USGS)
W81-02475

SUMMARY OF STREAMFLOW IN JEFFERSON COUNTY, ALABAMA,
Geological Survey of Alabama, University. Water Resources Div.
R. H. Bingham, and J. D. Moore.
Alabama Geological Survey Water Resources Division, University, Atlas 16, 1980. 21 p, 13 Fig, 2 Tab, 8 Ref.

Descriptors: *Streamflow, *Flow rates, *Alabama, Natural flow, Flow characteristics, *Flow duration, Duration curves, Discharge measurement, *Jefferson County(AL).

Flow-duration curves and streamflow distribution graphs based on 11 continuous-record gaging stations show that most gaged streams in Jefferson County, Ala., are perennial and flow varies seasonally. The largest discharge occurs in the spring and the smallest discharge occurs in the fall. Locust Fork is the largest potential source of surface water supply in Jefferson County. The average discharge of Locust Fork at Sayre is 1400 cubic feet per second for 40 years of discharge data. The average discharge of Fivemile Creek at Ketona is 35.7 cubic feet per second for 8 years of discharge data. Instantaneous discharge measurements at 62 sites in Jefferson County, where three or more measurements have been made are tabulated. (USGS)
W81-02476

CHEMICAL QUALITY OF WATER FROM COMMUNITY SYSTEMS IN NEW YORK, NOVEMBER 1970 TO MAY 1975,
Geological Survey, Albany, NY. Water Resources Div.
R. H. Cartwright, and J. A. Ziarno.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-130676, Price codes: A19 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-77 1980. 444 p, 1 Fig, 3 Tab, 20 Ref.

Descriptors: *Water quality, *Chemical analysis, *Data collections, *Water supply, *New York, Sampling, Water analysis, Pesticides, Potable water.

Chemical analyses of 2,802 water samples from 784 of approximately 1,500 community water systems in the State of New York are presented. The data were collected from November 1970 to May 1975 and were originally released in a series of four U.S. Geological Survey open-file reports during the mid-1970's. The data were obtained and compiled by the Geological Survey and have been used by the State of New York in determining community system compliance with applicable drinking-water standards. The analyses include physical properties, major and minor constituents, pesticide residues, and radiochemical data. Some bottom-material analyses are included. (USGS)
W81-02477

LOW-FLOW FREQUENCY AND FLOW DURATION OF SOUTH CAROLINA STREAMS,
Geological Survey, Columbia, SC. Water Resources Div.
W. M. Bloxham.
South Carolina Water Resources Commission Report No 11, 1979. 90 p, 5 Fig, 12 Ref.

Descriptors: *Low flow, *Low-flow frequency, *Flow duration, *Streamflow, *South Carolina, Streams, Analytical techniques, Frequency analysis, Natural flow, Regulated flow, Frequency curves, Gaging stations, Sites.

Streamflow data of 71 continuous record stations in South Carolina are shown in analytical summaries. Tabulations of low-flow frequency and flow-duration data and minimum flow arrays are preceded by a description of climate and physical factors. Explanations of the variables affecting low flow and the lack of homogeneity within the State are illustrated with low-flow frequency curves from different physiographic regions. A standard period of record common to each site could not be determined. Short records were adjusted to extend the length of sampling period by correlation and moderate frequency curve extensions. Low-flow frequency estimates are based on graphical rather than mathematical curve fittings because of the deviation of computed values at low probability levels. Regulation and diversion factors are accounted for in the analyses and identified in the station descriptions. (USGS)

PUBLIC PERCEPTIONS IN WATER QUALITY EVALUATION,
Auburn Univ., AL.
S. H. Dinius.
Water Resources Bulletin, Vol 17, No 1, p 116-121, February, 1981. 4 Tab, 10 Ref. OWRT A-054-ALA(3), 14-34-0001-7002.

Descriptors: *Water quality, *Water management, Water pollution, Water evaluation, Color, Public participation, Public opinion, Surface waters, Evaluation.

A Visual Perception Test, consisting of photographic slides of water sites, was designed to examine laymen's water quality perceptions. The slides were taken at five water sites where the level of visual pollution was artificially altered by the investigator. Analysis of variance indicated that the water sites were evaluated differently for each of five pollution levels. Increases in water discoloration and the quality of litter were viewed as increases in level of pollution. Laymen not only evaluated visually polluted sites lower for uses such as picnicking, but they also evaluated the quality of the actual water lower. Stepwise multiple regression indicated that a combination of water color, scenic beauty appreciation, quality of the surrounding environment and industry as a pollution source explained 73% of the variance in predicting Overall Pollution. Application of factor analysis simplified the variables to an Overall Pollution Factor and a Boating Use Factor.

8A. Structures

IF THE OLD RIVER CONTROL STRUCTURE FAILS. (THE PHYSICAL AND ECONOMIC CONSEQUENCES),
Louisiana Water Resources Research Inst., Baton Rouge.
R. G. Kazmann, and D. B. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-184103, Price codes: A07 in paper copy, A01 in microfiche. Technical addenda by J.R. Harris and D.B. Johnson, Bulletin 12, September, 1980. 135 p, 3 Fig, 19 Ref, 2 Append. OWRT-A-040-LA(3).

Descriptors: *Engineering structures, *Gates, *Control structures, *River flow, *Flow control, River regulation, Bypasses, Conduits, Structures, Check structures, Barriers, Construction materials, Construction, Repairing, Structural engineering, Engineering, Flow, Flow duration, Hydraulics, Streamflow, Regulation, Mississippi River, Atchafalaya River, *Louisiana.

The Old River Control Structure (ORCS), the device that prevents the Atchafalaya River from becoming the principal distributary, the new outlet, of the Mississippi River, and located about 40 miles north of Baton Rouge, Louisiana, was almost undermined by the flood of 1973. An auxiliary structure is presently planned for construction by the Corps of Engineers near the ORCS to reduce water flow through the present damaged ORCS; however, a real immediate threat exists for a major diversion of the Mississippi and the planned auxiliary structure cost is estimated at about $200,000,000. A major flood destroying the ORCS ability to distribution between the Lower Mississippi and Atchafalaya Rivers would occur in the Basin of the latter, and result in highway/railroad bridge destruction, gas pipelines severage, and reduced industrial productivity between Baton Rouge-New Orleans (BR-NO) along the Mississippi. Dry weather following the flood would reduce discharges in the river between BR-NO, permitting Gulf of Mexico saltwater to fill the present main stem of the river. Economic impacts were evaluated, and a plan described for replacing the BR-NO potable water supply. (Zielinski-IPA)

SOIL AND WATER CONSERVATION STRUCTURES, HYDRAULIC MODELS AND FIELD APPLICATIONS,
Science and Education Administration, Minneapolis, MN.
F. W. Blaisdell, C. L. Anderson, and G. G. Hebaus.
Advances in Agricultural Technology AAT-NC-6, December, 1980. 35 p, 34 Fig.

Descriptors: *Model studies, *Flood control, *Hydraulic structures, Soil conservation, Water conservation, Hydraulic models, Spillways, Stilling basins, Inlets, Culverts, Hydraulic design.

Weather or impassible roads during severe storms limit opportunities to see soil and water conservation structures passing large floods. However, models of these structures can be built in the laboratory and their performance observed under simulated severe flood conditions. Pictures are shown of models and their comparable prototypes to illustrate that models reliably predict the performance of field structures, that laboratory findings can be transposed to the field, and that soil conservation structures with superior hydraulic performance can be developed from laboratory tests. Small changes in the design or construction of a structure can cause large changes in the performance of that structure. Differences between good and poor structures are frequently small, and the effect of these differences on performance usually cannot be predicted, which is why laboratory tests are necessary. Types of structures illustrated include: drop spillways, straight drop spillway stilling basin, box inlet chute spillway entrance, box inlet drop spillway, open channels, culvert and chute stilling basins, pipe spillway entrances, hood inlets, hood inlet spillway entrances, drop inlets and antivortex devices, two-way drop inlet on a steep slope, two-stage two-way drop inlet as a floodwater retarding structure, and two-way drop inlet spillway entrances. W81-02504

WATER-RELATED SEDIMENT PROBLEMS,
E. L. Pemberton.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 4-1, p 1-30. 44 Fig, 1 Tab.

Descriptors: *Sediments, *Sediment load, *Sediment control, *Rivers, Canals, *Water distribution(Applied), Operating costs, Diversion structures, Distribution systems, Canal design, Channel morphology, Pumping plants, Return flow, Erosion control.

The types of sediment problems encountered either at a diversion structure or throughout a water distribution system may vary in different locations, but quite often have many comparable characteristics. The variations are usually attributable to differences in river channels and river hydraulics, sediment sizes, topographic changes, geology, and soil types. With a better knowledge of sediment transport concepts and river channel characteristics, these problems can be reduced, with a corresponding reduction in operating costs. Changes in design techniques are discussed for diversion structures and canal headworks, canal and distribution systems, pumping plants, stability of natural channels to convey waste flows and return flow, and miscellaneous river channel or sediment problems. Specific problems addressed include: deposition of sediment in river channel above a diversion dam and downstream bed and bank scour; sluicing arrangement not effective in reducing sand inflow to canal; cleaning sediment deposits from canal; need for settling basin at upper end of canal; canal siphons under river channels not buried deep enough for high flood peaks; cross drainage culverts sized for flood peaks as well as sediment loads; seepage from canal with clearer water diversion; sediment deposits in intake channels; wear factor for pumping sediment-laden water; excessive scour in wasteway channels; bed and bank erosion caused by return flows; use of unstable river channels as conveyance channels; bank erosion and channel stabilization; erosive action of sediment in water; and marina entrances. (Brambley-SRC)
W81-02515

REHABILITATION OF OPEN WATER CONVEYANCE SYSTEMS,
T. R. Haider.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 6-1, p 1-54. 40 Fig, 21 Ref, 1 Append.

Descriptors: *Irrigation systems, *Irrigation engineering, *Rehabilitation, *Water conveyance, Seepage control, Linings, Canals, Check structures, Siphons, Flumes, Chutes, Turnouts, Drainage engineering, Hydraulic design, Structural design, Economics, Safety factors, Maintenance.

Rehabilitation of irrigation systems may occur because routine maintenance is no longer sufficient, or modifications are required for greater efficiency, to meet current safety standards, or for automation. The repair versus replacement costs must be considered for any structure. The canal sections may need lining to control seepage; earth, concrete, and membrane liners are discussed. The structures in an irrigation system may include check structures, inverted siphons, inline flume structures, pipe and rectangular drop and chute structures, turnout structures, cross drainage structures, drainage inlets, and bridges. Changes in the hydraulic design and/or structural design of these structures are presented, with emphasis on economics and safety standards. (Brambley-SRC)

W81-02517

DESIGN, INSTALLATION, AND MAINTENANCE OF PIPE SYSTEMS,
L. A. Kinney, D. R. Osmundsen, and C. Davenport.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 8-1, p 1-15. 12 Fig.

Descriptors: *Irrigation systems, *Irrigation engineering, *Piping systems(Mechanical), *Pipelines, *Hydraulic design, *Sprinkler irrigation, Hydraulic structures, Excavation, Corrosion control, Installation, Maintenance, Resistivity, Soil properties.

Greater emphasis is being placed on the use of pipeline water distribution systems by the Water and Power Resources Service. There are three types of pipe systems, low-head, open stand; low-head, closed; and high-head, sprinkler. Most new installations are of the sprinkler type and older low-head systems are being converted, to obtain more efficient water use and reduce labor costs. The types of pipe and pipe joints to be used in any system depend on the location and conditions within the system. Pipes may be rigid or flexible, each requiring different trench, bedding and backfill conditions. Any pipe containing iron must be protected from corrosion; the amount of protection depends on the type of pipe and the soil resistivity and stray currents around the pipe. Correct installation can prevent maintenance problems; some problems and their solutions are presented. (Brambley-SRC)
W81-02518

DRAINAGE OF IRRIGATED LANDS,
J. N. Christopher.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Sessions 13-1 and 13-2, p 1-9.

Descriptors: *Irrigation systems, *Drainage systems, *Drains, *Drainage engineering, *Irrigation engineering, Saline soils, Saline water, Saturated soils, Soil physical properties, Groundwater, Groundwater movement, Recharge wells, Economics, Agricultural watersheds.

Drainage of irrigated land is almost always necessary to prevent waterlogging and salinization of the soil. Both conditions kill plants, by lack of oxygen in the root zone, and by their inability to absorb nutrients and water, respectively. In planning a drainage system, the specific yield and permeability of the soil, and the location, source and characteristics of the groundwater are the most important factors for consideration. The drainage system may use open or closed drains, pumped wells, or recharge wells. Closed drains are the preferred system in most cases, having the benefits of least cost, and least loss of land. Improved methods of predicting and determining subsurface drainage requirements have produced data on groundwater position and fluctuations, drain discharge methods, and permeabilities, which have been used to compute drain spacings with improved accuracy. Drain spacing and depth are interdependent, and for given conditions there is an economically optimum combination. The benefits of a gravel envelope around drains, and manholes, junction boxes and silt traps are discussed. (Brambley-SRC)
W81-02525

8C. Hydraulic Machinery

WATER MEASUREMENT,
R. G. Karrh, J. Crist, C. R. Buyalski, and R. A. Dodge.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Sessions 3-1 and 3-2, p 1-5.

Descriptors: *Water measurement, *Instrumentation, *Flow measurement, *Discharge measurement, Flow characteristics, Water resources, Maintenance, Reliability, Forecasting, Water supply(Development), Water delivery.

Accuracy in water measurement is important in the operation of any water system, so that future needs may be defined and anticipated. Standard devices are less expensive and generate more backup data and experience. A truly standard device is one which has been fully described, accurately calibrated, correctly made or installed, and sufficiently maintained to fulfill the original measurements, so that accurate water measurements may be obtained from standard discharge tables or curves. Accurate discharges from nonstandard structures can be obtained only from specially prepared curves or tables based on calibration tests. Inaccurate measurement may derive from flow factors such as approach and exit flow conditions, turbulence, and rough water surface; from equipment factors such as poor workmanship, weathered and worn equipment, faulty head measurement; or by infrequent measurement and the use of the wrong measuring device. Some causes of these factors are discussed. (Brambley-SRC)
W81-02514

PUMP AND MOTOR MAINTENANCE,
E. M. Corless.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 14-1, p 1-4.

Descriptors: *Pumps, *Electric motors, *Switchgear, *Maintenance, Electrical equipment, Hydraulic machinery, Lubricants, Vibration, Cavitation, Inspection, Insulation, Pump testing, Water conveyance, Pumping.

A failure in any of the three components of a pump, the pump, motor or switchgear, will cause the pump to be out of service. Pumps may be maintained in good working order by use of the proper lubrication in proper amounts, use of metalized shaft sleeves with correct packing, prevention of vibration and its immediate correction when it occurs, screening to keep foreign objects out of the pump, and selection of the correct pump for the job which prevents cavitation. Low pump discharge is usually caused by excessive wear or clearance at the pump seal, and can be corrected by replacing seals, building up the impeller or machining it to the correct tolerances. A permanent record of the pump's operating history is invaluable in determining if a pump is not working properly. Electric motors and switchgears are best maintained by keeping them clean, tight, dry, and cool. For motors, regular insulation testing should be conducted, with visual inspections, and permanent records maintained. These principles also apply to transformers. All work should be attempted only when the equipment is not energized. (Brambley-SRC)
W81-02526

8D. Soil Mechanics

EARTH CONSTRUCTION PRACTICES,
C. W. Jones.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 10-1, p 1-38. 22 Fig, 1 Tab, 14 Ref.

Descriptors: *Earth materials, *Construction materials, *Foundations, *Testing procedures, *Foundation investigations, Foundation bearing tests, Soil tests, Soil classification, Soil stability, Permeability, Erosion, Soil types, Embankments, Backfill.

Test procedures have been developed for evaluating foundation and conditions, to supplement judgement on the soundness of a foundation. The extent of testing depends on the importance of the structure, the seriousness of the soil conditions, and the steps that may be necessary to solve the problem. Some initial tests on the soil and subsoil include: bearing capacity; stability; settlement and uplift; deterioration; erosion; and permeability. Some common foundation problems and possible remedial measures are presented for consolidated and compressible clays, silts and intermediate soils, and sands and gravels. In the maintenance, repair and relocation of a water system soil is frequently used as a construction material. For satisfactory construction the soil must be classified and the cause and solution of the problem determined. Specific information is given for the repair and construction of embankments, preparation of backfill, compacted earth lining and cover layers. (Brambley-SRC)

8F. Concrete

CONCRETE REPAIR AND MAINTENANCE,
J. R. Graham, T. Rutenbeck, and O. R. Werner.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 9-2, p 1-23. 10 Fig, 3 Ref, 1 Append.

Descriptors: *Water management, *Concrete structures, *Concrete construction, *Maintenance, *Repairing, Water distribution(Applied), Gunite, Epoxy resins, Binders, Safety, Structures.

Most structures within a water system are made of concrete, and will need maintenance and ultimately repair. Concrete deterioration and failure can result from planning, design or construction deficiencies; unforeseen natural phenomena; and natural attrition and old age. Preventive maintenance will reduce the need for repair. A guide to material and repair method selection provides a logical systematic approach for decisions regarding the extent of the failure and the methods of repair. Proper preparation of the existing concrete is one of the most important steps to making a good, serviceable repair. Shotcrete, dry-pack, and concrete replacement are the most common and widely used methods of repair. Best bond strength for conventional concrete patches will be developed when the patch is kept completely moist for at least 28 days. When circumstances preclude wet-curing of concrete, chemical bonding agents such as epoxy formulations may be used. Procedures for the use of epoxy formulations are given, with emphasis on the need for temperature control. Epoxy-bonded epoxy mortar is particularly useful in patching spalls and cracks in concrete, without using portland cement or concrete. Safe handling of epoxies is described, and a list of supplies necessary for concrete repair work is given. (Brambley-SRC)

8G. Materials

SELECTION OF PROTECTIVE COATINGS,
C. B. Haverland.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 11-1, p 1-8.

Descriptors: *Protective coatings, *Decision making, *Paints, *Structures, Water management, Coatings, Weathering, Deterioration, Maintenance, Coal-tar coatings, Cathodic protection, Dips, Epoxy resins, Corrosion control, Waterproofing.

Rising costs dictate an active corrosion control program from water control structures, and protective coatings often emerge as the most economical means of mitigating corrosion. One of the important steps in the process of selecting the proper coating is determining the exposure to which the coating will be subjected. The basic categories of exposure include: immersion, burial, alternate submergence, atmospheric, and chemical. When these factors are combined with information on the nature of the structure to be protected, its condition, and practical considerations, a decision on the coating may be made. Specific coatings are discussed with reference to their applicability, advantages and disadvantages. They include: coal-tar enamel; cement mortar; vinyl resin systems; coal-tar epoxy paint; hot-dip galvanizing; silicone-alkyd enamels; and neoprene, latex, portland cement, epoxy, vinyl resin, enamel, and aluminum finish paints. Regular inspection of all coatings is recommended so that maintenance or replacement needs can be forecast. In the maintenance of existing submerged or buried steel structures, repainting may be very difficult or impossible. In this case, one way of affording continued protection may be to apply cathodic protection. However, cathodic protection currents develop an alkaline environment at the metal surface which can deteriorate the bond of certain coatings. (Brambley-SRC)
W81-02521

PREPARATION AND APPLICATION OF PROTECTIVE COATINGS,
H. F. Adams.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 11-2, p 1-10.

Descriptors: *Protective coatings, *Corrosion control, *Paints, *Maintenance, Structures, Surfaces, Coatings, Economics, Cleaning, Abrasive blasting, Curing.

Correctly selected and applied coatings serve longer and require less maintenance, reducing the long-term coating costs. Preparation of the base surface, mixing or other preparation of the paint, and application to the surface are discussed in the light of maintenance conditions and primarily with respect to metal. Practical maintenance problems include timing to obtain satisfactory temperatures, ventilation, humidity control, and safety practices, particularly when dealing with new products. Surface preparation may require the removal of foreign substances from the surface, removal of all loose materials or removal of all materials by blast cleaning. Most paints require mixing to obtain uniform consistency, but some require the addition and complete mixing of a catalyst which causes setting of the paint by a chemical reaction. Application of paint by brushing, roller, or spray will be determined by the structure, the paint and number of coats to be applied. Sufficient time must be allowed after application for curing of the paint and inspection of the work. (Brambley-SRC)
W81-02522

CATHODIC PROTECTION OF SURFACES,
H. K. Uyeda.
In: Water Systems Management Workshop, 1980, Session Notes, Department of the Interior, Water and Power Resources Service, Session 11-3, p 1-10.

Descriptors: *Cathodic protection, *Corrosion control, *Metals, *Surfaces, Electrolytes, Cost-benefit analysis, Anodes, Cathodes, Structures, Water loss, Electrolysis, *Pipelines.

Cathodic protection is the reduction or elimination of corrosion of a metal by making current flow to it from an electrolyte. Both galvanic or local cell corrosion and electrolytic or stray-current corrosion may be controlled. In the galvanic anode method, corrosion is controlled by purposely creating a corrosion cell by use of a bimetallic couple, in which the anode corrodes, saving the structure planned as the cathode. In the impressed current method anodes are used which are energized by an external, direct-current power source. Each method has characteristics which make it more applicable to particular situations than the other. Successful cathodic protection requires a suitable continuous electrolyte common to both the anode and the structure, a method of making current flow in the desired direction, and a method of getting sufficient current to every point on the surface of the structure. Each system is a special case which requires thorough preliminary testing, but a structure-to-electrolyte potential of -0.85 volt or more is recommended. The cost of installing cathodic protection varies with the structure, the system and the direct and indirect costs assigned to the consequences of corrosion. (Brambley-SRC)

Identification of Organic Sulfur Compounds and Polycyclic Hydrocarbons Transferred to Shellfish from Petroleum Suspension by Capillary Mass Chromatography,
W81-02578 5A

Metals in Nereid Polychaetes: The Contribution of Metals in the Jaws to the Total Body Burden,
W81-02615 5A

Microbiological Parameters for Differentiating between Coastal and Open Waters in the Northern Baltic Proper and the Gulf of Finland,
W81-02641 5C

BIOLOGICAL TREATMENT
Investigation of Full-Scale Biological Batch Treatment of Intermittent Waste Water Flows,
W81-02409 5D

Chemical and Biological Treatment of Thermally Conditioned Sludge Recycle Liquors,
W81-02506 5E

Bayer Tower Biology - An Efficient, Low Noise and Odor-Free Process for Biological Waste Water Treatment,
W81-02553 5D

Design of Fixed-Film Processes with Steady-State-Biofilm Model,
W81-02556 5D

BLUEGILLS
Bioconcentration of Linear Alkylbenzene Sulfonate (LAS) in Bluegill (Lepomis Macrochirus),
W81-02576 5C

BOREHOLE GEOPHYSICS
Scintillation Detectors in Gamma Spectral Logging: Geometry, Absorption and Calibration,
W81-02460 7B

BREWERY INDUSTRY
Anaerobic Digestion of Brewery By-Products,
W81-02621 5D

BUBBLES
Practical Problems Related to Nitrogen Bubble Formation in Fixed Film Reactors,
W81-02555 5D

CADMIUM
Utilisation of Sewage Sludge on Land--The Cadmium Angle.
W81-02586 3C

CALIBRATIONS
Scintillation Detectors in Gamma Spectral Logging: Geometry, Absorption and Calibration,
W81-02460 7B

Calibration and Testing of Selected Portable Flowmeters for Use on Large Irrigation Systems,
W81-02464 7B

CALIFORNIA
Floods of January and February 1980 in California,
W81-02457 2E

Relation Between Proposed Developments of Water Resources and Seepage from the All-American Canal, Eastern Imperial Valley, California,
W81-02465 4A

Water Resources Data for California, Water Year 1979--Volume 4. Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W81-02470 7C

Quality of Urban Runoff, Tecolote Creek Drainage Area, San Diego County, California,
W81-02480 5B

Water Resources and Geology of the Los Coyotes Indian Reservation and Vicinity, San Diego County, California,
W81-02487 4B

A Geologic Approach to Artificial Recharge Site Selection in the Fresno-Clovis Area, California,
W81-02508 4B

Techniques for Creating Salt Marshes Along the California Coast,
W81-02532 5G

CANADA
Supplemental Report on Phosphorus Management Strategies.
W81-02439 5G

Great Lakes Science Advisory Board: Report of the Aquatic Ecosystem Objectives Committee.
W81-02440 5G

Cotidal Charts for Canada,
W81-02445 2L

Unslaked Lime--Its Direct Use In Phosphorus Removal Processes.
W81-02545 5D

Occurrence and Distribution of Oxygen and Organic Compounds in Mountain Streams of the Marmot Basin,
W81-02627 2K

CANAL LININGS
Canal Linings and Soil Sealants,
W81-02517 3F

CANAL SEEPAGE
Relation Between Proposed Developments of Water Resources and Seepage from the All-American Canal, Eastern Imperial Valley, California,
W81-02465 4A

CARIBBEAN REGION
Summary Appraisals of the Nation's Groundwater Resources--Caribbean Region,
W81-02473 4B

CATHODIC PROTECTION
Cathodic Protection of Surfaces,
W81-02523 8G

CENTRAL AND NORTHERN LOUISIANA
Water Resources Data for Louisiana, Water Year 1980--Volume 1. Central and Northern Louisiana.
W81-02469 7C

CHANNEL FLOW
Point-Velocity Discharge Measurement Method for Sewers,
W81-02616 7B

CHANNELS
Water Related Problems in the Coastal Zone of Louisiana,
W81-02509 4A

CHELATION
Metals Removal and Recovery from Municipal Sludge,
W81-02612 5E

CHEMICAL ANALYSIS
Thermal Springs in the Payette River Basin, West-Central Idaho,
W81-02472 1A

A Compilation of Groundwater Quality Data For Kentucky.
W81-02475 7C

Chemical Quality of Water from Community Systems in New York, November 1970 to May 1975,
W81-02477 7C

Flameless Atomic Absorption for Tracing the Fate of Heavy Metals in Soils and Groundwater,
W81-02491 5A

CHEMICAL PRECIPITATION
A General Equilibrium Model for the Precipitation of Phosphate with Iron and Aluminium,
W81-02557 5D

CHEMICAL TREATMENT
Chemical and Biological Treatment of Thermally Conditioned Sludge Recycle Liquors,
W81-02506 5E

CHEMICAL WASTES
Synthetic Organic Compounds in Groundwater,
W81-02599 5B

CHLORINATED HYDROCARBONS
Prechlorination and Trihalomethane Formation at Water Treatment Plants,
W81-02547 5F

CHLORINATION
Prechlorination and Trihalomethane Formation at Water Treatment Plants,
W81-02547 5F

CLAMS
Identification of Organic Sulfur Compounds and Polycyclic Hydrocarbons Transferred to Shellfish from Petroleum Suspension by Capillary Mass Chromatography,
W81-02578 5A

CLOUD PHYSICS
The HIPLEX Program in Colby-Goodland, Kansas: 1976-1980,
W81-02501 2B

COAGULATION
A Comparative Study of Various Coagulants for the Renovation of Secondary Effluents,
W81-02560 5D

Mechanism Underlying the Removal of Organic Micropollutants during Flocculation by an Aluminum or Iron Salt,
W81-02634 5D

COAL MINES
Physical Environment and Hydrologic Characteristics of Coal-Mining Areas in Missouri,
W81-02448 5C

Groundwater of Coal Deposits, Bay County, Michigan,
W81-02486 5B

COASTAL STRUCTURES
Water Related Problems in the Coastal Zone of Louisiana,
W81-02509 4A

COASTS
Water Related Problems in the Coastal Zone of Louisiana,
W81-02509 4A

Nutrient Cycling in Coastal Ecosystems,
W81-02541 5C

COLIFORMS
Microorganisms in Stormwater--A Summary of Recent Investigations,
W81-02478 5B

Comparative Study of Membrane Filtration Methods for the Isolation of Group D Streptococci from Water,
W81-02581 5A

COLORADO
Municipal Water Use in Northern Colorado: Development of an Efficiency-of-Use Criterion,
W81-02401 3D

Hydrology and Chemical Quality of Groundwater in Crowley County, Colorado,
W81-02451 7C

COLORADO RIVER
Cost Effect Stream-Gaging Strategies for the Lower Colorado River Basin: The Blythe Field Office Operations,
W81-02455 6B

Sediment and Water Discharge of the Colorado River at Matagorda, Texas, May 4-7, and June 7-11, 1979,
W81-02459 2J

COLUMBIA RIVER
Conflicts Over the Columbia River, Seminar Conducted by Water Resources Research Institute, Oregon State University, Spring Quarter 1980.
W81-02418 6B

COMPUTER MODELS
Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume I, Executive Summary,
W81-02413 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume II, Limits of the Washington Metropolitan Water Supply System,
W81-02414 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume III, Potomac River Interactive Simulation Model,
W81-02415 6B

Water, Energy, and Economic Development towards an Integrated Regional Policy Analysis System, Selected Background Essays.
W81-02431 6B

A Methodology for Assessing the Regional Inter-Relationships of Water Resources, Energy Supply and Economic Development.
W81-02432 6B

A Summary of Energy Models and Energy Demand Projections for New England,
W81-02434 6B

Electric Sector Planning Models,
W81-02435 6B

An Analysis of Assumptions behind Regional Economic Development Projection Methodologies,
W81-02436 6B

Development of a Digital Model of Groundwater Flow in Deeply Weathered Crystalline Rock, Chester County, Pennsylvania,
W81-02446 2F

Relation Between Proposed Developments of Water Resources and Seepage from the All-American Canal, Eastern Imperial Valley, California,
W81-02465 4A

Streamflow Model of Wisconsin River for Estimating Flood Frequency and Volume,
W81-02474 2E

Hydrologic Effects of Proposed Changes in Management Practices, Winnebago Pool, Wisconsin,
W81-02479 4A

Three-Dimensional Digital-Computer Model of the Ferron Sandstone Aquifer Near Emery, Utah,
W81-02481 2F

COMPUTER PROGRAMS
Analysis and Dissemination of Water Quality and Water Quantity Data,
W81-02424 7C

COMPUTER PROGRAMS

Computer Program for Network Analysis for Regional Information,
W81-02483 7A

Computer-Based Monitoring for Avonmouth STW.
W81-02589 7B

COMPUTERS
Water Systems Automation and Management, Part 4,
W81-02513 7B

Automatic Computerized Computation of an Optimal Sewerage Network by Dynamic Programming,
W81-02588 6A

CONCRETE CONSTRUCTION
Concrete Repair and Maintenance,
W81-02519 8F

CONCRETE STRUCTURES
Concrete Repair and Maintenance,
W81-02519 8F

CONSTRUCTION MATERIALS
Earth Construction Practices,
W81-02520 8D

CONTINENTAL SHELF
Trace Metal Concentrations in Sediment Cores from the Continental Shelf Off the Southeastern United States,
W81-02427 5A

CONTROL STRUCTURES
If the Old River Control Structure Fails. (The Physical and Economic Consequences),
W81-02426 8A

COOLING TOWERS
Seawater Cooling Tower Shows Few Problems in Five Years,
W81-02552 3C

COPEPODS
Responses of Copepod Individuals and Populations to Increased Temperature Variability,
W81-02406 5C

Sublethal Effects of Pollutants: Life Table Evaluation of Chronic Exposure of Eurytemora Affinis (Copepoda) to Kepone,
W81-02408 5C

CORALVILLE RESERVOIR
Fate and Transport of Dieldrin in Coralville Reservoir: Residues in Fish and Water Following a Pesticide Ban,
W81-02571 5B

CORROSION CONTROL
Preparation and Application of Protective Coatings,
W81-02522 8G

Cathodic Protection of Surfaces,
W81-02523 8G

COST ANALYSIS
Impact of Availability of Water and Cost of Energy Inputs on Agricultural Production in the Oklahoma Panhandle,
W81-02410 3F

Cost Effect Stream-Gaging Strategies for the Lower Colorado River Basin: The Blythe Field Office Operations,
W81-02455 6B

The Demand for Water Transportation: Application of Discriminant Analysis to Commodities Shipped by Barge and Competing Modes in Ohio River and Arkansas River Areas,
W81-02502 6B

Removal and Recovery of Metals and Phosphates from Municipal Sewage Sludge,
W81-02505 5E

Automatic Computerized Computation of an Optimal Sewerage Network by Dynamic Programming,
W81-02588 6A

COST-BENEFIT ANALYSIS
Decision Problems in the Control of Acid Precipitation: Nonconvexities and Irreversibilities,
W81-02637 5C

COST SHARING
Minimizing Treatment Costs in Multiplant Settings,
W81-02647 6C

COSTS
Evaluation of Extended Aeration Activated Sludge Package Plants,
W81-02611 5D

Package Plants: A Cost-Effective Solution to Small Water System Treatment Needs,
W81-02632 6B

COXSACKIE VIRUS
Identification and Detection of Water-Borne Viruses by Immunoenzymatic Methods,
W81-02528 5A

CROP PRODUCTION
Impact of Availability of Water and Cost of Energy Inputs on Agricultural Production in the Oklahoma Panhandle,
W81-02410 3F

CRYSTALLINE ROCKS
Development of a Digital Model of Groundwater Flow in Deeply Weathered Crystalline Rock, Chester County, Pennsylvania,
W81-02446 2F

CULTIVATION
Slot Mulch for Runoff and Erosion Control,
W81-02638 4D

CULTURES
Modified Rotary Shaker Platform,
W81-02442 7B

CYCLING NUTRIENTS
Nutrient Cycling in Coastal Ecosystems,
W81-02541 5C

DADE COUNTY (FL)
Water-Level Contour and Salt-Front Map, Hialeah-Miami Springs Well Field Area, Dade County, Florida, October 13, 1978,
W81-02461 7C

DAMSITES
Research Design and Mitigation Plan for the Yellowhouse Dam and Reservoir, Pueblo of Zuni, New Mexico,
W81-02500 6B

DAPHNIA
Laboratory Simulation of Acid Rain Effects on Freshwater Microcrustaceans,
W81-02407 5C

DATA COLLECTIONS
Chemical Quality of Water from Community Systems in New York, November 1970 to May 1975,
W81-02477 7C

Computer Program for Network Analysis for Regional Information,
W81-02483 7A

DATA PROCESSING
Water Systems Automation and Management, Part 4,
W81-02513 7B

DATA TRANSMISSION
Telemetry System at Grafham Water Scheme.
W81-02600 7B

DECISION MAKING
Selection of Protective Coatings,
W81-02521 8G

DEGRADATION (DECOMPOSITION)
Microbial Biodegradation and Chemical Evolution of Oil from the Amoco Spill,
W81-02643 5C

DENITRIFICATION
Practical Problems Related to Nitrogen Bubble Formation in Fixed Film Reactors,
W81-02555 5D

Kinetics of Biological Fluidized Bed Waste Water Denitrification,
W81-02562 5D

Denitrification of Water for Human Consumption,
W81-02563 5F

Industrial Waste Carbon Sources for Biological Denitrification,
W81-02564 5D

Kinetic Model of Biological Denitrification in a Fluidized Bed Biofilm Reactor (FBBR),
W81-02565 5D

Biological Nitrogen Removal by Step-Feed Process,
W81-02566 5D

DESALINATION
National Survey of Water and Waste Water Desalting Plant Operator Certification Programs,
W81-02425 3A

DESALINATION APPARATUS
Light-Driven Water Desalinization through Artificial Membranes Containing Bacteriorhodopsin,
W81-02429 3A

DESALINATION PLANTS
National Survey of Water and Waste Water Desalting Plant Operator Certification Programs,
W81-02425 3A

DESALINATION PROCESSES
Light-Driven Water Desalinization through Artificial Membranes Containing Bacteriorhodopsin,

ENVIRONMENTAL PROTECTION AGENCY
Reagan Team's Blueprint to EPA.
W81-02613 6E

EROSION CONTROL
Slot Mulch for Runoff and Erosion Control,
W81-02638 4D

ESTIMATED COSTS
Some Aspects of Institutional Analysis for Water, Energy and Economic Development in the New England Region,
W81-02437 6B

ESTIMATING
Bivariate Gamma Distributions for Extending Annual Streamflow Records from Precipitation: Some Large-Scale Results,
W81-02585 2E

ESTUARIES
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

Tidal Response in Estuaries,
W81-02631 2L

A Study of Tidal Energy Dissipation and Bottom Stress in an Estuary,
W81-02640 2L

ESTUARINE ENVIRONMENT
Nutrient Cycling in Coastal Ecosystems,
W81-02541 5C

EUTROPHICATION
An Approach for the Evaluation of Efficacy of Wetlands-Based Phosphorus Control Programs for Eutrophication-Related Water Quality Improvement in Downstream Waterbodies,
W81-02595 5C

EVALUATION
Summary Appraisals of the Nation's Groundwater Resources--Caribbean Region,
W81-02473 4B

EVAPOTRANSPIRATION
Agricultural Water Demand Prediction Using Remote Sensing Technology for Georgia Resource Management,
W81-02428 6B

FAULT TREE ANALYSIS
Fault Tree Analysis and Treatment Plant Instrumentation,
W81-02624 5D

FEDERAL PROJECT POLICY
Effective Waste Water Management Planning,
W81-02567 6E

FERMENTATION
Anaerobic Treatment of Wastes Containing Methanol and Higher Alcohols,
W81-02584 5D

FILTERS
Practical Problems Related to Nitrogen Bubble Formation in Fixed Film Reactors,
W81-02555 5D

FILTRATION
Optimal Advanced Treatment and Phosphorous Removal by Deep Bed Filtration,
W81-02559 5D

FINITE ELEMENT ANALYSIS
Three-Dimensional Digital-Computer Model of the Ferron Sandstone Aquifer Near Emery, Utah,
W81-02481 2F

FISH MANAGEMENT
Conflicts Over the Columbia River, Seminar Conducted by Water Resources Research Institute, Oregon State University, Spring Quarter 1980.
W81-02418 6B

FISH PHYSIOLOGY
Water Quality Characteristics and Physiological Responses of Fish Held in Recirculating Systems,
W81-02496 3C

FISH STOCKING
A Simple in Situ Method for Measuring Benthic Respiration,
W81-02573 2H

FISHKILL
Sublethal Effects of Pollutants: Life Table Evaluation of Chronic Exposure of Eurytemora Affinis (Copepoda) to Kepone,
W81-02408 5C

FLOCCULATION
Optimal Advanced Treatment and Phosphorous Removal by Deep Bed Filtration,
W81-02559 5D

FLOOD CONTROL
A Process for Community Flood Plain Management, Summary Report.
W81-02420 6A

Soil and Water Conservation Structures, Hydraulic Models and Field Applications,
W81-02504 8A

FLOOD-CONTROL STORAGE
Feasibility of Irrigating with Water from SCS Floodwater-Retarding Impoundments,
W81-02544 3F

FLOOD DAMAGE
Floods in Indiana, June-August 1979,
W81-02471 2E

FLOOD DATA
Floods of January and February 1980 in California,
W81-02457 2E

FLOOD DISCHARGE
Streamflow Model of Wisconsin River for Estimating Flood Frequency and Volume,
W81-02474 2E

FLOOD FLOW
Floods of January and February 1980 in California,
W81-02457 2E

FLOOD FORECASTING
Geomorphic-Hydrologic Methods for Assessing Flood Potential in Southern New England,
W81-02495 2E

FLOOD FREQUENCY
Streamflow Model of Wisconsin River for Estimating Flood Frequency and Volume,
W81-02474 2E

FLOOD PLAINS
A Process for Community Flood Plain Management, Summary Report.
W81-02420 6A

Geomorphic-Hydrologic Methods for Assessing Flood Potential in Southern New England,
W81-02495 2E

FLOOD PROTECTION
A Process for Community Flood Plain Management, Summary Report.
W81-02420 6A

The Perfect Telemetry Mix,
W81-02590 7B

FLOODS
Floods of January and February 1980 in California,
W81-02457 2E

Floods in Indiana, June-August 1979,

Water Resources Data for Mississippi, Water Year 1979.
W81-02468 7C

Water Resources Data for Louisiana, Water Year 1980--Volume 1. Central and Northern Louisiana.
W81-02469 7C

Water Resources Data for California, Water Year 1979--Volume 4. Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W81-02470 7C

A Compilation of Groundwater Quality Data For Kentucky.
W81-02475 7C

Geohydrology of the Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes in the Northeast Texas Salt-Dome Basin,
W81-02482 5E

Groundwater of Coal Deposits, Bay County, Michigan,
W81-02486 5B

The Importance of Groundwater Monitoring,
W81-02598 5B

Synthetic Organic Compounds in Groundwater,
W81-02599 5B

To What Extent is Ground Water Contaminated,
W81-02601 5B

Microbiology of Groundwater,
W81-02607 5B

GROUNDWATER AVAILABILITY
Groundwater Availability Near Fort Wayne, Allen County, Indiana,
W81-02466 2F

GROUNDWATER MANAGEMENT
A Geologic Approach to Artificial Recharge Site Selection in the Fresno-Clovis Area, California,
W81-02508 4B

Groundwater Management with Fixed Charges,
W81-02605 4B

GROUNDWATER MOVEMENT
Development of a Digital Model of Groundwater Flow in Deeply Weathered Crystalline Rock, Chester County, Pennsylvania,
W81-02446 2F

Three-Dimensional Digital-Computer Model of the Ferron Sandstone Aquifer Near Emery, Utah,
W81-02481 2F

GROUNDWATER POLLUTION
Effect of Pretreatment on Groundwater Contamination from Leaching Beds,
W81-02548 5D

The Potential for Groundwater Contamination from Septic Effluents,
W81-02628 5B

GROUNDWATER POTENTIAL
Groundwater Availability Near Fort Wayne, Allen County, Indiana,
W81-02466 2F

GROUNDWATER RECHARGE
A Geologic Approach to Artificial Recharge Site Selection in the Fresno-Clovis Area, California,
W81-02508 4B

Renovation of Waste Water by Soil Columns Flooded With Primary Effluent,
W81-02603 5D

GROUNDWATER RESOURCES
Groundwater Appraisal in Northwestern Big Stone County, West-Central Minnesota,
W81-02454 2F

Groundwater Availability Near Fort Wayne, Allen County, Indiana,
W81-02466 2F

Summary Appraisals of the Nation's Groundwater Resources--Caribbean Region,
W81-02473 4B

Water Resources and Geology of the Los Coyotes Indian Reservation and Vicinity, San Diego County, California,
W81-02487 4B

HABITATS
Coastal Habitat Development in the Dredged Material Research Program,
W81-02537 6G

HAZARDOUS MATERIALS
Hazardous Waste Management: State by State.
W81-02597 5B

HEAVY METALS
Trace Metal Concentrations in Sediment Cores from the Continental Shelf Off the Southeastern United States,
W81-02427 5A

Flameless Atomic Absorption for Tracing the Fate of Heavy Metals in Soils and Groundwater,
W81-02491 5A

Salt Marsh Creation: Impact of Heavy Metals,
W81-02538 5C

Concentrations of Heavy Metals in Forty Sewage Sludges in England,
W81-02594 5A

HERITAGE FOUNDATION
Reagan Team's Blueprint to EPA.
W81-02613 6E

HUECO BOLSON
Appraisal of Potential for Injection-Well Recharge of the Hueco Bolson with Treated Sewage Effluent--Preliminary Study of the Northeast El Paso Area, Texas,
W81-02458 4B

HYDRAULIC DESIGN
Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

HYDRAULIC STRUCTURES
Soil and Water Conservation Structures, Hydraulic Models and Field Applications,
W81-02504 8A

HYDROGEN ION CONCENTRATION
Laboratory Simulation of Acid Rain Effects on Freshwater Microcrustaceans,
W81-02407 5C

HYDROGEOLOGY
Physical Environment and Hydrologic Characteristics of Coal-Mining Areas in Missouri,
W81-02448 5C

Hydrology and Chemical Quality of Groundwater in Crowley County, Colorado,
W81-02451 7C

Geohydrology of the Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes in the Northeast Texas Salt-Dome Basin,
W81-02482 5E

HYDROLOGIC DATA
Analysis and Dissemination of Water Quality and Water Quantity Data,
W81-02424 7C

Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

Selected Hydrologic Data from the Vicinity of Rayburns and Vacherie Salt Domes, Northern Louisiana Salt-Dome Basin,
W81-02456 5E

Water Resources Data for New Hampshire and Vermont, Water Year 1979.
W81-02467 7C

Water Resources Data for Mississippi, Water Year 1979.
W81-02468 7C

Water Resources Data for Louisiana, Water Year 1980--Volume 1. Central and Northern Louisiana.
W81-02469 7C

Water Resources Data for California, Water Year 1979--Volume 4. Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W81-02470 7C

A Compilation of Groundwater Quality Data For Kentucky.
W81-02475 7C

ICE COVER
Satellite Observation of Great Lakes Ice - Winter 1978-79,
W81-02507 2C

ICE FORMATION
Satellite Observation of Great Lakes Ice - Winter 1978-79,
W81-02507 2C

IDAHO
Thermal Springs in the Payette River Basin, West-Central Idaho,
W81-02472 1A

ILLINOIS
Water Resources Activities in Illinois, 1980,
W81-02485 7A

IMPAIRED WATER USE
Marine Biotechnology and the Use of Arid Zones,
W81-02570 3C

Utilisation of Sewage Sludge on Land--The Cadmium Angle.
W81-02586 3C

IMPOUNDMENTS
Distribution of Trace Elements in a Warm Water Release Impoundment,
W81-02402 5A

Appendices for Distribution of Trace Elements in a Warm Water Release Impoundment,
W81-02403 5A

INCINERATION
Removal and Recovery of Metals and Phosphates from Municipal Sewage Sludge,
W81-02505 5E

INDIA
Effect of Sewage and Industrial Wastes on the Floristic Composition and Distribution of Macrophytic Vegetation in the River Khan,
W81-02574 5C

INDIAN RESERVATIONS
Water Resources and Geology of the Los Coyotes Indian Reservation and Vicinity, San Diego County, California,
W81-02487 4B

Research Design and Mitigation Plan for the Yellowhouse Dam and Reservoir, Pueblo of Zuni, New Mexico,
W81-02500 6B

INDIANA
Groundwater Availability Near Fort Wayne, Allen County, Indiana,
W81-02466 2F

Floods in Indiana, June-August 1979,
W81-02471 2E

INDUSTRIAL WASTES
Activated Sludge and Activated Carbon Treatment of a Wood Preserving Effluent Containing Pentachlorophenol,
W81-02441 5D

Evaluation of Sorbents for Industrial Sludge Leachate Treatment,
W81-02503 5D

Truck Washing Terminal Water Pollution Control,
W81-02527 5D

Electrolytic Treatment of Oily Waste Water from Manufacturing and Machining Plants,
W81-02529 5D

Industrial Waste Carbon Sources for Biological Denitrification,
W81-02564 5D

INDUSTRIAL WATER
Industrial Water Conservation within the Great Lakes Region: An Overview,
W81-02633 3E

INFILTRATION
Snowmelt Infiltration and Runoff on Frozen Ground,
W81-02421 2A

INFILTRATION RATES
Renovation of Waste Water by Soil Columns Flooded With Primary Effluent,
W81-02603 5D

INFORMATION RETRIEVAL
Analysis and Dissemination of Water Quality and Water Quantity Data,
W81-02424 7C

INJECTION WELLS
Aquifers as Processing Plants for the Modification of Injected Water,
W81-02412 5D

Appraisal of Potential for Injection-Well Recharge of the Hueco Bolson with Treated Sewage Effluent--Preliminary Study of the Northeast El Paso Area, Texas,
W81-02458 4B

INPUT-OUTPUT ANALYSIS
A Usable Input-Output Flow Chart of a Municipal Water System,
W81-02636 6A

INSTALLATION COSTS
Groundwater Management with Fixed Charges,
W81-02605 4B

INSTITUTIONAL CONSTRAINTS
Some Aspects of Institutional Analysis for Water, Energy and Economic Development in the New England Region,
W81-02437 6B

INSTITUTIONS
Water, Energy, and Economic Development towards an Integrated Regional Policy Analysis System,
W81-02430 6B

INSTRUMENTATION
Water Measurement,
W81-02514 8C

The Perfect Telemetry Mix,
W81-02590 7B

Monitoring Device Simplifies Sample Collection.
W81-02596 5A

Fault Tree Analysis and Treatment Plant Instrumentation,
W81-02624 5D

INTERNATIONAL WATERS
Conflicts Over the Columbia River, Seminar Conducted by Water Resources Research Institute, Oregon State University, Spring Quarter 1980.
W81-02418 6B

Supplemental Report on Phosphorus Management Strategies.
W81-02439 5G

Great Lakes Science Advisory Board: Report of the Aquatic Ecosystem Objectives Committee.
W81-02440 5G

INTERSTATE RIVERS
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

IRRADIATION
Sewage Sludge Hygienisation Plant Supplies Fertiliser,
W81-02591 3C

IRRIGATION
Protein and Nitrate Content of Lemna Sp. as a Function of Developmental Stage and Incubation Temperature,
W81-02497 2I

Sprinkler Head with an Improved Slotted Drive Spoon,
W81-02629 3F

Sprinkler Head with Improved Combined Stream Coherency Diffuser and Distance Control Baffle Member,
W81-02630 3F

IRRIGATION DISTRICTS
Water Systems Automation and Management, Part 4,
W81-02513 7B

IRRIGATION EFFICIENCY
Water Systems Automation and Management, Part 2,
W81-02511 3F

Water Systems Automation and Management, Part 3,
W81-02512 3F

IRRIGATION ENGINEERING
Water Systems Automation and Management, Part 2,
W81-02511 3F

Rehabilitation of Open Water Conveyance Systems,
W81-02516 8A

Canal Linings and Soil Sealants,
W81-02517 3F

Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

Drainage of Irrigated Lands,
W81-02525 8A

IRRIGATION PRACTICES
Assuring Sustained Irrigation in the Northern Great Plains by Soil-Water Interaction Studies,
W81-02423 3F

IRRIGATION PROGRAMS
Feasibility of Irrigating with Water from SCS Floodwater-Retarding Impoundments,
W81-02544 3F

IRRIGATION REQUIREMENTS
Agricultural Water Demand Prediction Using Remote Sensing Technology for Georgia Resource Management,
W81-02428 6B

IRRIGATION SYSTEMS
Calibration and Testing of Selected Portable Flowmeters for Use on Large Irrigation Systems,
W81-02464 7B

Water Systems Automation and Management, Part 2,
W81-02511 3F

Water Systems Automation and Management, Part 3,
W81-02512 3F

Water Systems Automation and Management, Part 4,
W81-02513 7B

Rehabilitation of Open Water Conveyance Systems,
W81-02516 8A

Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

Vegetation Management and Pest Control,
W81-02524 4A

Drainage of Irrigated Lands,
W81-02525 8A

IRRIGATION WATER
Treatment of Irrigation Water for the Removal of Fungi and Nematodes,
W81-02443 5G

IRRIGATION WELLS
Maps Showing Groundwater Conditions in the Upper San Pedro Basin Area, Pima, Santa Cruz, and Cochise Counties, Arizona--1978,
W81-02462 7C

ISOLATION
Comparative Study of Membrane Filtration Methods for the Isolation of Group D Streptococci from Water,
W81-02581 5A

JEFFERSON COUNTY (AL)
Summary of Streamflow in Jefferson County, Alabama,
W81-02476 7C

JOINT COSTS
Minimizing Treatment Costs in Multiplant Settings,
W81-02647 6C

KENTUCKY
A Compilation of Groundwater Quality Data For Kentucky.
W81-02475 7C

KINETICS
Nitrification Kinetics in a Rotating Biological Disk Reactor,
W81-02554 5D

Design of Fixed-Film Processes with Steady-State-Biofilm Model,
W81-02556 5D

Kinetics of Biological Fluidized Bed Waste Water Denitrification,
W81-02562 5D

Kinetic Model of Biological Denitrification in a Fluidized Bed Biofilm Reactor (FBBR),
W81-02565 5D

LABORATORY EQUIPMENT
Modified Rotary Shaker Platform,
W81-02442 7B

LABORATORY TESTS
Modified Rotary Shaker Platform,
W81-02442 7B

LAKE DEATON (FL)
Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

LAKE ICE
Satellite Observation of Great Lakes Ice - Winter 1978-79,
W81-02507 2C

LAKE MORPHOLOGY
Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

LAKE OKAHUMPKA (FL)
Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

LAKE OKEECHOBEE
An Approach for the Evaluation of Efficacy of Wetlands-Based Phosphorus Control Programs for Eutrophication-Related Water Quality Improvement in Downstream Waterbodies,
W81-02595 5C

LAKE PONTCHARTRAIN
Effects of Salinity Stratification and Adverse Water Quality on the Benthic Invertebrate Community of Southern Lake Pontchartrain, Louisiana,
W81-02417 5C

LAKE SEDIMENTS
Benthic Oxygen Demand in Lake Apopka, Florida,
W81-02575 2H

LAKE WINNEBAGO (WI)
Hydrologic Effects of Proposed Changes in Management Practices, Winnebago Pool, Wisconsin,
W81-02479 4A

LAKES
Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

Water Quality Data for Aquifers, Streams, and Lakes in the Vicinity of Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes, Northeast Texas Salt-Dome Basin,
W81-02463 7C

A Water Quality Study of Placid Lake and Its Drainage,
W81-02493 5A

Satellite Observation of Great Lakes Ice - Winter 1978-79,
W81-02507 2C

The Linear Plot: A New Way of Interpreting Titration Data, Used in Determination of Weak Acids in Lake Water,
W81-02592 5A

The Fate of Sewage Phosphorus Input to a Subarctic Lake Chain,
W81-02593 5B

Enrichment of Lake Wingra, Wisconsin, by Submersed Macrophyte Decay,
W81-02602 2H

LAND USE
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

LANDSLIDES
Water Use, Groundwater Conditions, and Slope Failure on Benchlands in Western Montana: The Darby Slide Example,
W81-02494 2J

LEACHATES
Evaluation of Sorbents for Industrial Sludge Leachate Treatment,
W81-02503 5D

LEACHING
Effect of Pretreatment on Groundwater Contamination from Leaching Beds,
W81-02548 5D

LEGAL ASPECTS
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

New Directions in Water Policy, Seminar Conducted by Water Resources Research Institute, Oregon State University, Fall Quarter 1979.
W81-02419 6E

LEGISLATION
Hazardous Waste Management: State by State.
W81-02597 5B

LIGNITE
Lignite Liquefaction Waste Water: Suitability for Reuse and Clean Up for Discharge into the Environment,
W81-02490 5D

LIME
Unslaked Lime--Its Direct Use In Phosphorus Removal Processes.
W81-02545 5D

Lime Treatment of Waste Water: Development and Application of a Simple Graphical Technique for Predicting the Chemical Composition of Lime-Treated Secondary Effluent,
W81-02561 5D

LIQUEFACTION
Lignite Liquefaction Waste Water: Suitability for Reuse and Clean Up for Discharge into the Environment,
W81-02490 5D

LITTLE NARRAGANSETT BAY
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

LOS COYOTES INDIAN RESERVATION
Water Resources and Geology of the Los Coyotes Indian Reservation and Vicinity, San Diego County, California,
W81-02487 4B

LOUISIANA
Aquifers as Processing Plants for the Modification of Injected Water,
W81-02412 5D

Effects of Salinity Stratification and Adverse Water Quality on the Benthic Invertebrate Community of Southern Lake Pontchartrain, Louisiana,
W81-02417 5C

If the Old River Control Structure Fails. (The Physical and Economic Consequences),
W81-02426 8A

Selected Hydrologic Data from the Vicinity of Rayburns and Vacherie Salt Domes, Northern Louisiana Salt-Dome Basin,
W81-02456 5E

Water Resources Data for Louisiana, Water Year 1980--Volume 1. Central and Northern Louisiana.
W81-02469 7C

Water Related Problems in the Coastal Zone of Louisiana,
W81-02509 4A

LOW FLOW
Low-Flow Frequency and Flow Duration of South Carolina Streams,
W81-02484 7C

LOW-FLOW AUGMENTATION
Hydrologic Effects of Proposed Changes in Management Practices, Winnebago Pool, Wisconsin,
W81-02479 4A

LOW-FLOW FREQUENCY
Low-Flow Frequency and Flow Duration of South Carolina Streams,
W81-02484 7C

LOWER COLORADO RIVER BASIN
Cost Effect Stream-Gaging Strategies for the Lower Colorado River Basin: The Blythe Field Office Operations,
W81-02455 6B

MACROPHYTES
Effect of Sewage and Industrial Wastes on the Floristic Composition and Distribution of Macrophytic Vegetation in the River Khan,
W81-02574 5C

MAINTENANCE
Concrete Repair and Maintenance,
W81-02519 8F

Preparation and Application of Protective Coatings,
W81-02522 8G

Pump and Motor Maintenance,
W81-02526 8C

MANAGEMENT
Mangrove Swamp Creation,

NUCLEAR WASTES
Selected Hydrologic Data from the Vicinity of Rayburns and Vacherie Salt Domes, Northern Louisiana Salt-Dome Basin,
W81-02456 5E

NUTRIENT REMOVAL
Protein and Nitrate Content of Lemna Sp. as a Function of Developmental Stage and Incubation Temperature,
W81-02497 2I

NUTRIENTS
Supplemental Report on Phosphorus Management Strategies.
W81-02439 5G

NUTRIENTS

A Water Quality Study of Placid Lake and Its Drainage,
W81-02493 5A

The Fate of Sewage Phosphorus Input to a Subarctic Lake Chain,
W81-02593 5B

Enrichment of Lake Wingra, Wisconsin, by Submersed Macrophyte Decay,
W81-02602 2H

Municipal Waste Water Reutilization on Cultivated Soil,
W81-02619 5E

ODOR

Raw Water Studies Determine Siting of New Intake,
W81-02635 5F

OHIO RIVER

The Demand for Water Transportation: Application of Discriminant Analysis to Commodities Shipped by Barge and Competing Modes in Ohio River and Arkansas River Areas,
W81-02502 6B

OIL POLLUTION

Identification of Organic Sulfur Compounds and Polycyclic Hydrocarbons Transferred to Shellfish from Petroleum Suspension by Capillary Mass Chromatography,
W81-02578 5A

OIL SPILLS

Initial Effects of Amoco Cadiz Oil on Intertidal Algae,
W81-02642 5C

Microbial Biodegradation and Chemical Evolution of Oil from the Amoco Spill,
W81-02643 5C

The Amoco Cadiz Oil Spill: An Ecological Impact Study,
W81-02644 5C

The Oil Spill Age--Fate and Effects of Oil in the Marine Environment,
W81-02645 5B

Pollution of Subtidal Sediments and Disturbance of Benthic Animal Communities,
W81-02646 5C

OIL WASTES

Anaerobic Treatment Kinetics of Palm Oil Sludge,
W81-02580 5D

OILY WATER

Electrolytic Treatment of Oily Waste Water from Manufacturing and Machining Plants,
W81-02529 5D

OKLAHOMA

Impact of Availability of Water and Cost of Energy Inputs on Agricultural Production in the Oklahoma Panhandle,
W81-02410 3F

Feasibility of Irrigating with Water from SCS Floodwater-Retarding Impoundments,
W81-02544 3F

ON-SITE TESTS

A Simple in Situ Method for Measuring Benthic Respiration,
W81-02573 2H

OPERATING COSTS

Bayer Tower Biology - An Efficient, Low Noise and Odor-Free Process for Biological Waste Water Treatment,
W81-02553 5D

Biological Nitrogen Removal by Step-Feed Process,
W81-02566 5D

OPTIMIZATION

Optimal Expansion of a Water Resource System and Issues of Water Allocation and Utilization: Umatilla River Basin, Oregon,
W81-02416 6B

OREGON

Optimal Expansion of a Water Resource System and Issues of Water Allocation and Utilization: Umatilla River Basin, Oregon,
W81-02416 6B

Conflicts Over the Columbia River, Seminar Conducted by Water Resources Research Institute, Oregon State University, Spring Quarter 1980.
W81-02418 6B

New Directions in Water Policy, Seminar Conducted by Water Resources Research Institute, Oregon State University, Fall Quarter 1979.
W81-02419 6E

Salt Marsh Creation in the Pacific Northwest: Criteria, Planting Techniques, and Costs,
W81-02533 5G

ORGANIC COMPOUNDS

Work Plan for the Schuylkill River Basin, Pennsylvania: Assessment of River Quality as Related to the Distribution and Transport of Trace Metals and Organic Substances,
W81-02488 5B

Direct Analytical Method for Aliphatic Compounds in Water by Steam Carrier Gas Chromatography,
W81-02579 5A

Synthetic Organic Compounds in Groundwater,
W81-02599 5B

Sources of Soluble Organic Nitrogen in Activated Sludge Effluents,
W81-02617 5B

Production of Soluble Organic Nitrogen during Activated Sludge Treatment,
W81-02618 5B

Occurrence and Distribution of Oxygen and Organic Compounds in Mountain Streams of the Marmot Basin,
W81-02627 2K

ORGANIC PESTICIDES

Sublethal Effects of Pollutants: Life Table Evaluation of Chronic Exposure of Eurytemora Affinis (Copepoda) to Kepone,
W81-02408 5C

ORGANIC WASTES

Mechanism Underlying the Removal of Organic Micropollutants during Flocculation by an Aluminum or Iron Salt,
W81-02634 5D

OTTAWA

Raw Water Studies Determine Siting of New Intake,
W81-02635 5F

OXYGEN DEMAND

Benthic Oxygen Demand in Lake Apopka, Florida,
W81-02575 2H

Testing Aeration Equipment in Conventional Activated Sludge Plants,
W81-02623 5D

PACKAGE PLANTS

Evaluation of Extended Aeration Activated Sludge Package Plants,
W81-02611 5D

Package Plants: A Cost-Effective Solution to Small Water System Treatment Needs,
W81-02632 6B

PAINTS

Selection of Protective Coatings,
W81-02521 8G

Preparation and Application of Protective Coatings,
W81-02522 8G

PATENTS

Process for Purification of Contaminated Water,
W81-02626 5F

Sprinkler Head with an Improved Slotted Drive Spoon,
W81-02629 3F

Sprinkler Head with Improved Combined Stream Coherency Diffuser and Distance Control Baffle Member,
W81-02630 3F

PATH OF POLLUTANTS

Technique for Determining the Volatilization Coefficients of Priority Pollutants in Streams,
W81-02583 5B

The Fate of Sewage Phosphorus Input to a Subarctic Lake Chain,
W81-02593 5B

The Potential for Groundwater Contamination from Septic Effluents,
W81-02628 5B

The Oil Spill Age--Fate and Effects of Oil in the Marine Environment,
W81-02645 5B

PATHOGENIC BACTERIA

Are Public and Recreational Water Supplies in Montana Safe from Yersinia Enterocolitica Gastroenteritis,
W81-02492 5A

Microbiology: Detection of Bacterial Pathogens and Their Occurrence,
W81-02609 5A

PAYETTE RIVER BASIN (ID)

Thermal Springs in the Payette River Basin, West-Central Idaho,
W81-02472 1A

PEAK DISCHARGE

Floods of January and February 1980 in California,
W81-02457 2E

Floods in Indiana, June-August 1979,
W81-02471 2E

PENNSYLVANIA

Development of a Digital Model of Groundwater Flow in Deeply Weathered Crystalline Rock, Chester County, Pennsylvania,
W81-02446 2F

Effects of Strip Mining the Abandoned Deep Anna S Mine on the Hydrology of Babb Creek, Tioga County, Pennsylvania,
W81-02447 5B

Work Plan for the Schuylkill River Basin, Pennsylvania: Assessment of River Quality as Related to the Distribution and Transport of Trace Metals and Organic Substances,
W81-02488 5B

PERFORMANCE

Evaluation of Extended Aeration Activated Sludge Package Plants,
W81-02611 5D

Package Plants: A Cost-Effective Solution to Small Water System Treatment Needs,
W81-02632 6B

PEST CONTROL
Vegetation Management and Pest Control,
W81-02524 4A

PESTICIDE RESIDUES
Fate and Transport of Dieldrin in Coralville Reservoir: Residues in Fish and Water Following a Pesticide Ban,
W81-02571 5B

PESTICIDE TOXICITY
Sublethal Effects of Pollutants: Life Table Evaluation of Chronic Exposure of Eurytemora Affinis (Copepoda) to Kepone,
W81-02408 5C

PESTICIDES
Marsh Creation: Impact of Pesticides on the Fauna, Use of Infrared Photography, Ditching and Diking,
W81-02539 5C

Marsh Creation: Effects of Pesticides on the Flora,
W81-02540 5C

PHENOLS
Activated Sludge and Activated Carbon Treatment of a Wood Preserving Effluent Containing Pentachlorophenol,
W81-02441 5D

PHOSPHATES
A General Equilibrium Model for the Precipitation of Phosphate with Iron and Aluminium,
W81-02557 5D

PHOSPHORUS
Supplemental Report on Phosphorus Management Strategies.
W81-02439 5G

Optimal Advanced Treatment and Phosphorous Removal by Deep Bed Filtration,
W81-02559 5D

PHOSPHORUS COMPOUNDS
The Fate of Sewage Phosphorus Input to a Subarctic Lake Chain,
W81-02593 5B

An Approach for the Evaluation of Efficacy of Wetlands-Based Phosphorus Control Programs for Eutrophication-Related Water Quality Improvement in Downstream Waterbodies,
W81-02595 5C

PHOSPHORUS REMOVAL
Unslaked Lime--Its Direct Use In Phosphorus Removal Processes.
W81-02545 5D

PHYTOPLANKTON
Marine Biotechnology and the Use of Arid Zones,
W81-02570 3C

PILOT PLANTS
Pilot Plant Studies of Rotating Biological Contactors Treating Municipal Waste Water,
W81-02438 5D

PILOT PLANTS *WATER QUALITY CONTROL
Advanced Waste Treatment of Industrial Waste Waters for Non-Potable Reuse Using Mobile Treatment Units,
W81-02489 5D

PIPELINES
Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

Cathodic Protection of Surfaces,
W81-02523 8G

PIPING SYSTEMS (MECHANICAL)
Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

PLANNING
Water Resources Problems and Research Needs, New York State, 1982-1987.
W81-02411 6B

New Directions in Water Policy, Seminar Conducted by Water Resources Research Institute, Oregon State University, Fall Quarter 1979.
W81-02419 6E

A Process for Community Flood Plain Management, Summary Report.
W81-02420 6A

A Builder's Guide to Water and Energy,
W81-02422 6B

Energy Impact Analysis in Water Project Planning,
W81-02648 6B

ICPRB and Washington Metro Water Management,
W81-02649 6E

Design of Length of Water Resource Simulation Experiments,
W81-02650 6B

PLANT POPULATIONS
Protein and Nitrate Content of Lemna Sp. as a Function of Developmental Stage and Incubation Temperature,
W81-02497 2I

POLAROGRAPHIC ANALYSIS
Polarographic Measurement of Surface-Active Material in Natural Waters,
W81-02582 5A

POLICY MAKING
Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume I, Executive Summary,
W81-02413 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume II, Limits of the Washington Metropolitan Water Supply System,
W81-02414 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume III, Potomac River Interactive Simulation Model,
W81-02415 6B

POLLUTANT IDENTIFICATION
Flameless Atomic Absorption for Tracing the Fate of Heavy Metals in Soils and Groundwater,
W81-02491 5A

Identification and Detection of Water-Borne Viruses by Immunoenzymatic Methods,
W81-02528 5A

Direct Analytical Method for Aliphatic Compounds in Water by Steam Carrier Gas Chromatography,
W81-02579 5A

Comparative Study of Membrane Filtration Methods for the Isolation of Group D Streptococci from Water,
W81-02581 5A

Polarographic Measurement of Surface-Active Material in Natural Waters,
W81-02582 5A

The Linear Plot: A New Way of Interpreting Titration Data, Used in Determination of Weak Acids in Lake Water,
W81-02592 5A

Concentrations of Heavy Metals in Forty Sewage Sludges in England,

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume I, Executive Summary,
W81-02413 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume II, Limits of the Washington Metropolitan Water Supply System,
W81-02414 6B

Policy Analysis of Reservoir Operation in the Potomac River Basin, Volume III, Potomac River Interactive Simulation Model,
W81-02415 6B

SITE SELECTION
A Geologic Approach to Artificial Recharge Site Selection in the Fresno-Clovis Area, California,
W81-02508 4B

SLOPE DEGRADATION
Water Use, Groundwater Conditions, and Slope Failure on Benchlands in Western Montana: The Darby Slide Example,
W81-02494 2J

SLUDGE DIGESTION
Role of Nematode-Bacterial Interactions in Heterotrophic Systems with Emphasis on Sewage Sludge Decomposition,
W81-02551 5D

SLUDGE DIGESTION

Anaerobic Treatment Kinetics of Palm Oil Sludge,
W81-02580 5D

Anaerobic Treatment of Wastes Containing Methanol and Higher Alcohols,
W81-02584 5D

Submerged Combustion for Sludge Digestion,
W81-02587 5D

SLUDGE DISPOSAL
Evaluation of Sorbents for Industrial Sludge Leachate Treatment,
W81-02503 5D

Removal and Recovery of Metals and Phosphates from Municipal Sewage Sludge,
W81-02505 5E

Chemical and Biological Treatment of Thermally Conditioned Sludge Recycle Liquors,
W81-02506 5E

Utilisation of Sewage Sludge on Land--The Cadmium Angle.
W81-02586 3C

Concentrations of Heavy Metals in Forty Sewage Sludges in England,
W81-02594 5A

SLUDGE TREATMENT
Sewage Sludge Hygienisation Plant Supplies Fertiliser,
W81-02591 3C

Metals Removal and Recovery from Municipal Sludge,
W81-02612 5E

SNOWMELT
Snowmelt Infiltration and Runoff on Frozen Ground,
W81-02421 2A

SOIL AMENDMENTS
Utilisation of Sewage Sludge on Land--The Cadmium Angle.
W81-02586 3C

SOIL FORMATION
Salt Marsh Soil Development,
W81-02534 5G

SOIL MOISTURE
Snowmelt Infiltration and Runoff on Frozen Ground,
W81-02421 2A

SOIL SEALANTS
Canal Linings and Soil Sealants,
W81-02517 3F

SOIL-WATER-PLANT RELATIONSHIPS
Assuring Sustained Irrigation in the Northern Great Plains by Soil-Water Interaction Studies,
W81-02423 3F

SOUTH AFRICA
Treatment of Irrigation Water for the Removal of Fungi and Nematodes,
W81-02443 5G

SOUTH CAROLINA
Low-Flow Frequency and Flow Duration of South Carolina Streams,
W81-02484 7C

SOUTH DAKOTA
Assuring Sustained Irrigation in the Northern Great Plains by Soil-Water Interaction Studies,
W81-02423 3F

Major Aquifers in Aurora and Jerauld Counties, South Dakota,
W81-02449 2F

SPARTINA
Techniques for Creating Salt Marshes Along the California Coast,
W81-02532 5G

SPRINKLER IRRIGATION
Design, Installation, and Maintenance of Pipe Systems,
W81-02518 8A

Sprinkler Head with an Improved Slotted Drive Spoon,
W81-02629 3F

Sprinkler Head with Improved Combined Stream Coherency Diffuser and Distance Control Baffle Member,
W81-02630 3F

STANDARDS
Microbiology of Water--Quality Assurance,
W81-02606 5A

STEAM GAGES
Cost Effect Stream-Gaging Strategies for the Lower Colorado River Basin: The Blythe Field Office Operations,
W81-02455 6B

STORM RUNOFF
Microorganisms in Stormwater--A Summary of Recent Investigations,
W81-02478 5B

STORM WATER
Microorganisms in Stormwater--A Summary of Recent Investigations,
W81-02478 5B

STORMS
Quality of Urban Runoff, Tecolote Creek Drainage Area, San Diego County, California,
W81-02480 5B

STRATIFICATION
Effects of Salinity Stratification and Adverse Water Quality on the Benthic Invertebrate Community of Southern Lake Pontchartrain, Louisiana,
W81-02417 5C

STREAMFLOW
Sediment and Water Discharge of the Colorado River at Matagorda, Texas, May 4-7, and June 7-11, 1979,
W81-02459 2J

Floods in Indiana, June-August 1979,
W81-02471 2E

Streamflow Model of Wisconsin River for Estimating Flood Frequency and Volume,
W81-02474 2E

Summary of Streamflow in Jefferson County, Alabama,
W81-02476 7C

Low-Flow Frequency and Flow Duration of South Carolina Streams,
W81-02484 7C

STREAMFLOW FORECASTING
Bivariate Gamma Distributions for Extending Annual Streamflow Records from Precipitation: Some Large-Scale Results,
W81-02585 2E

STREAMS
Water Quality Data for Aquifers, Streams, and Lakes in the Vicinity of Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes, Northeast Texas Salt-Dome Basin,
W81-02463 7C

STRIP MINES
Effects of Strip Mining the Abandoned Deep Anna S Mine on the Hydrology of Babb Creek, Tioga County, Pennsylvania,
W81-02447 5B

STRUCTURES
Selection of Protective Coatings,
W81-02521 8G

SUBMERGED COMBUSTION
Submerged Combustion for Sludge Digestion,
W81-02587 5D

SUBSTRATES
Salt Marsh Substrate Interaction: Microorganisms,
W81-02535 5G

SUMTER COUNTY (FL)
Hydrology of the Lake Deaton and Lake Okahumpka Area, Northeast Sumter County, Florida,
W81-02452 2H

SUNFISHES
Bioconcentration of Linear Alkylbenzene Sulfonate (LAS) in Bluegill (Lepomis Macrochirus),
W81-02576 5C

SUPPLEMENTAL IRRIGATION
Feasibility of Irrigating with Water from SCS Floodwater-Retarding Impoundments,
W81-02544 3F

SURFACE RUNOFF
Suspended Sediment Production Potential on Undisturbed Forest Land,
W81-02639 2J

SURFACE WATERS
Water Resources Data for New Hampshire and Vermont, Water Year 1979.
W81-02467 7C

Water Resources Data for Mississippi, Water Year 1979.
W81-02468 7C

Water Resources Data for Louisiana, Water Year 1980--Volume 1. Central and Northern Louisiana.
W81-02469 7C

Water Resources Data for California, Water Year 1979--Volume 4. Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W81-02470 7C

SURFACES
Cathodic Protection of Surfaces,
W81-02523 8G

SURFACTANTS
Polarographic Measurement of Surface-Active Material in Natural Waters,
W81-02582 5A

SURVEYS
National Survey of Water and Waste Water Desalting Plant Operator Certification Programs,
W81-02425 3A

SUSPENDED SEDIMENTS
Suspended Sediment Production Potential on Undisturbed Forest Land,
W81-02639 2J

SWITCHGEAR
Pump and Motor Maintenance,
W81-02526 8C

SYNTHETIC RUBBER
Mercury(II) Sorption by Waste Rubber,
W81-02572 5D

SYSTEMS ANALYSIS
A Usable Input-Output Flow Chart of a Municipal Water System,
W81-02636 6A

TELEMETRY
The Perfect Telemetry Mix,
W81-02590 7B

Telemetry System at Grafham Water Scheme.
W81-02600 7B

TERTIARY TREATMENT
Water Reclamation by Combined Electrodialysis/Ultrafiltration,
W81-02405 5D

TESTING
Calibration and Testing of Selected Portable Flowmeters for Use on Large Irrigation Systems,
W81-02464 7B

TESTING PROCEDURES
Earth Construction Practices,
W81-02520 8D

TEXAS
Altitude of the Water Table in the Alluvial and Wilcox Aquifers in the Vicinity of Richland and Tehuacana Creeks and the Trinity River, Texas, December 1979,
W81-02453 7C

Appraisal of Potential for Injection-Well Recharge of the Hueco Bolson with Treated Sewage Effluent--Preliminary Study of the Northeast El Paso Area, Texas,
W81-02458 4B

Sediment and Water Discharge of the Colorado River at Matagorda, Texas, May 4-7, and June 7-11, 1979,
W81-02459 2J

Water Quality Data for Aquifers, Streams, and Lakes in the Vicinity of Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes, Northeast Texas Salt-Dome Basin,
W81-02463 7C

Geohydrology of the Keechi, Mount Sylvan, Oakwood, and Palestine Salt Domes in the Northeast Texas Salt-Dome Basin,
W81-02482 5E

THERMAL POLLUTION
Responses of Copepod Individuals and Populations to Increased Temperature Variability,
W81-02406 5C

THERMAL SPRINGS
Thermal Springs in the Payette River Basin, West-Central Idaho,
W81-02472 1A

TIDAL ENERGY
A Study of Tidal Energy Dissipation and Bottom Stress in an Estuary,
W81-02640 2L

TIDAL HYDRAULICS
Tidal Response in Estuaries,
W81-02631 2L

TIDAL STREAMS
Tidal Response in Estuaries,
W81-02631 2L

TIDAL WATERS
Cotidal Charts for Canada,
W81-02445 2L

TIDES
Cotidal Charts for Canada,
W81-02445 2L

Tidal Response in Estuaries,
W81-02631 2L

TOXICITY
Laboratory Simulation of Acid Rain Effects on Freshwater Microcrustaceans,
W81-02407 5C

TRACE ELEMENTS
Distribution of Trace Elements in a Warm Water Release Impoundment,
W81-02402 5A

Appendices for Distribution of Trace Elements in a Warm Water Release Impoundment,
W81-02403 5A

Trace Metal Concentrations in Sediment Cores from the Continental Shelf Off the Southeastern United States,
W81-02427 5A

Work Plan for the Schuylkill River Basin, Pennsylvania: Assessment of River Quality as Related to the Distribution and Transport of Trace Metals and Organic Substances,
W81-02488 5B

A Revised Estimate for Trace Metal Fluxes to Narragansett Bay: A Comment,
W81-02549 5A

A Revised Estimate for Trace Metal Fluxes to Narragansett Bay: A Reply,
W81-02550 5A

TRACERS
Mixing Efficiencies in Full-Scale Anaerobic Digesters by Tracer Methods,
W81-02620 5D

TRACKING TECHNIQUES
Technique for Determining the Volatilization Coefficients of Priority Pollutants in Streams,
W81-02583 5B

TRANSPORTATION
The Demand for Water Transportation: Application of Discriminant Analysis to Commodities Shipped by Barge and Competing Modes in Ohio River and Arkansas River Areas,
W81-02502 6B

TREATED WATER
Appraisal of Potential for Injection-Well Recharge of the Hueco Bolson with Treated Sewage Effluent--Preliminary Study of the Northeast El Paso Area, Texas,
W81-02458 4B

TREATMENT FACILITIES
Waste Water Treatment Plant Features Pumping Flexibility,
W81-02568 5D

TRINITY RIVER (TX)
Altitude of the Water Table in the Alluvial and Wilcox Aquifers in the Vicinity of Richland and Tehuacana Creeks and the Trinity River, Texas, December 1979,
W81-02453 7C

UMATILLA RIVER BASIN
Optimal Expansion of a Water Resource System and Issues of Water Allocation and Utilization: Umatilla River Basin, Oregon,
W81-02416 6B

UNDERGROUND WASTE DISPOSAL
Selected Hydrologic Data from the Vicinity of Rayburns and Vacherie Salt Domes, Northern Louisiana Salt-Dome Basin,
W81-02456 5E

UPPER SAN PEDRO BASIN AREA (AZ)
Maps Showing Groundwater Conditions in the Upper San Pedro Basin Area, Pima, Santa Cruz, and Cochise Counties, Arizona--1978,
W81-02462 7C

URBAN DRAINAGE
Proposed Model Policies for Urban Drainage Management.
W81-02546 4A

URBAN PLANNING
Proposed Model Policies for Urban Drainage Management.
W81-02546 4A

URBAN RUNOFF
Quality of Urban Runoff, Tecolote Creek Drainage Area, San Diego County, California,
W81-02480 5B

URBANIZATION
Water Quality Legal Issues and Land Use in a Shared Estuary,
W81-02404 6E

A Builder's Guide to Water and Energy,
W81-02422 6B

UTAH
Three-Dimensional Digital-Computer Model of the Ferron Sandstone Aquifer Near Emery, Utah,
W81-02481 2F

UTILITIES
Declining Block Rates Can Encourage Water Conservation,
W81-02614 6C

VACUUM SEWERS
Vacuum Waste Water Collection: The Alternative Selected in Queen Anne's County, Maryland,
W81-02622 5D

VEGETATION EFFECTS
Vegetation Management and Pest Control,
W81-02524 4A

VEGETATION ESTABLISHMENT
Techniques for Creating Salt Marshes Along the East Coast,
W81-02530 5G

Creation of a Southeastern United States Salt Marsh on Dredged Material,
W81-02531 5G

Techniques for Creating Salt Marshes Along the California Coast,
W81-02532 5G

Salt Marsh Creation in the Pacific Northwest: Criteria, Planting Techniques, and Costs,
W81-02533 5G

Mangrove Swamp Creation,
W81-02536 5G

VERMONT
Water Resources Data for New Hampshire and Vermont, Water Year 1979.
W81-02467 7C

VIRGIN ISLANDS
Summary Appraisals of the Nation's Groundwater Resources--Caribbean Region,
W81-02473 4B

VIRUSES
Identification and Detection of Water-Borne Viruses by Immunoenzymatic Methods,
W81-02528 5A

VOLATILITY
Non-Biological Elimination Mechanisms in a Biological Sewage Treatment Plant,
W81-02558 5D

Technique for Determining the Volatilization Coefficients of Priority Pollutants in Streams,
W81-02583 5B

VOLUMETRIC ANALYSIS
The Linear Plot: A New Way of Interpreting Titration Data, Used in Determination of Weak Acids in Lake Water,
W81-02592 5A

WASH WATER
Truck Washing Terminal Water Pollution Control,
W81-02527 5D

WASTE DISPOSAL
Hazardous Waste Management: State by State.
W81-02597 5B

WASTE RECOVERY
Removal and Recovery of Metals and Phosphates from Municipal Sewage Sludge,
W81-02505 5E

WASTE WATER
Thermal Analysis of the ISCO 1680 Portable Waste Water Sampler,
W81-02499 7B

Vacuum Waste Water Collection: The Alternative Selected in Queen Anne's County, Maryland,
W81-02622 5D

WASTE WATER DISPOSAL
Municipal Waste Water Reutilization on Cultivated Soil,
W81-02619 5E

WASTE WATER MANAGEMENT
Effective Waste Water Management Planning,
W81-02567 6E

WASTE WATER TREATMENT
Water Reclamation by Combined Electrodialysis/Ultrafiltration,
W81-02405 5D

Investigation of Full-Scale Biological Batch Treatment of Intermittent Waste Water Flows,
W81-02409 5D

Pilot Plant Studies of Rotating Biological Contactors Treating Municipal Waste Water,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 14
JULY 15, 1981

W81-02651 -- W81-02900
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 14
JULY 15, 1981

W81-02651 -- W81-02900

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

THE STRUCTURE OF HYDROCHEMICAL FIELDS AND SHORT-TERM PREDICTION,
Gidrokhimicheskii Inst., Rostov-na-Donu (USSR).
A. M. Nikanorov, B. M. Vladimirskiy, V. L. Pavelko, Y. V. Melniko, and K. L. Botsenyuk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche.
In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80. p 156-179, 4 Fig, 9 Tab, 7 Ref.

Descriptors: *Mathematical models, *Prediction, *Chemical properties, Anions, Cations, *Volga River(USSR), Mathematical studies, Reservoirs, Tributaries, Regression analysis, Factor analysis, Russia.

Empirical models are necessary to predict phenomena which do not have a theoretical interpretation. Analysis of the structure of hydrochemical fields and the resulting empirical descriptions are inseparably related both to the points of measurement selected and to the mathematical apparatus used. Some 30,000 previously published results of hydrochemical indices in reservoirs along the Volga River and its tributaries were used in factor and regression analyses. It was found that by selecting the concentration of calcium and bicarbonate ions, it was possible to predict four other variables-magnesium and chloride ions, the sum of ions, and total hardness. Parameters of the empirical models are determined which can be used to make the transition from integral charcteristics to particular characteristics for a predetermined point so that the spatial structure of the hydrochemical field may be determined. The methods of analysis suggested do not contradict the concept of the field used in hydrochemistry, and can be used in the prediction of space-time characteristics of hydrochemical indices, providing optimization of the network, with respect to spatial parameters and to time. 2B. Precipitation

PRELIMINARY ANALYSIS OF REGIONAL-PRECIPITATION PERIODICITY,
Geological Survey, Lawrence, KS. Water Resources Div.
C. A. Perry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161630, Price codes: A03 in paper copy, A01 in microfiche.
Geological Survey Water-Resources Investigations 80-74, September 1980. 26 p, 9 Fig, 22 Ref.

Descriptors: *Precipitation(Atmospheric), *Hydrologic cycle, *Droughts, *Climatology, *Meteorology, Time series analysis, Regional analysis, Magnetic studies, Variability, Cycles, Precipitation periodicity, Solar-weather interrelationships.

Precipitation variability plays a major role in nearly every aspect of the hydrologic cycle. Precipitation is not a random event, but it occurs after a sequence of prerequisites has been fulfilled. Recent investigations have shown that activity of the sun can affect atmospheric vorticity, an important factor in precipitation formation. Solar activity is known to be periodic; therefore, through a complex series of physical processes, precipitation variance is solar forced to a certain degree. A preliminary analysis of precipitation periodicity was made for eight regions scattered across the central United States. Each region contained 5 to 10 stations with long-term precipitation records that were averaged to obtain yearly regional-precipitation values. Graphic analysis shows 11-year and 22-year cycles that are nearly in phase with the solar cycles. An example of the effect of cyclic precipitation is presented for the Powder River basin in Wyoming and Montana. A cycle of 22 years exhibits fluctuations of approximately 22 to 27% for precipitation and 38 to 50% for runoff. A more detailed study that investigates solar-forced precipitation cycles and their relationship to hydrologic processes is needed. (USGS)

ANALYSES OF SOUTH AFRICAN RAINFALL,
Commonwealth Scientific and Industrial Research Organization, South Melbourne (Australia). Div. of Chemical Technology.
R. G. Vines.
South African Journal of Science, Vol 76, No 9, p 404-409, September, 1980. 10 Fig, 16 Ref.

Descriptors: *Rainfall, *Sunspots, *South Africa, *Cycles, Precipitation, Droughts, Weather, Australia, New Zealand, Tasmania, Forecasting, Weather forecasting.

Filter analysis of South African rainfall data in the south and northeast shows quasi-periodic fluctuations of 16-20, 10-12, and 6-7 years. The 16-20 and 6-7 year cycles are common to the whole country, but the 10-12 year wave in the south is out of phase with the northeast. Comparisons with precipitation data (some as far back as 1895) for southeast Australia, Tasmania, and New Zealand suggests correlation with the 10-12 year sunspot cycle. The results of the present analysis are in accord with Tyson and Dyer's estimate of the likelihood of extending drought conditions over much of South Africa in the mid 1980's. Although it is possible to suggest only broad estimates of future trends, even crude estimates could be useful for some planning purposes. (Cassar-FRC)

EVALUATION OF PEAK-FLOW DATA NETWORK OF SMALL STREAMS IN MISSOURI,
Geological Survey, Rolla, MO. Water Resources Div.
L. D. Hauth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156242, Price codes: A03 in paper copy, A01 in microfiche.
Geological Survey Water-Resources Investigations 80-87, 1980. 38 p, 9 Fig, 8 Tab, 21 Ref.

Descriptors: *Peak discharge, *Small watersheds, *Missouri, *Flood frequency, Flood recurrence interval, Estimating, Regression analysis, Networks, Data collections, Stream gages, Evaluation.

Standard regression models were used as a tool to evaluate the transferability of streamflow characteristics for the small-streams network in Missouri. Station records were divided into segments and tested for adequacy of record length and sample size for two physiographic regions. The standard error of estimate for each calibrated regression model, using increasing record lengths, was compared against the longest period of record in both tests. Results of the study indicate that an increase in the length of small-area streamflow records or additional sampling sites in the data network will not substantially improve the standard error of estimate of the regression model. Therefore, it is recommended that the current (1980) crest-stage network be reduced to a sample large enough to measure the long-term trend and provide information for future capabilities in the field of small-streams hydrology. It is also recommended that additional research be carried out to determine additional variables which could be used to predict floodflows and other types of regression models. (USGS)

BEHAVIORAL AND CATASTROPHIC DRIFT OF INVERTEBRATES IN TWO STREAMS IN NORTHEASTERN WYOMING,
Geological Survey, Cheyenne, WY. Water Resources Div.
D. J. Wangsness, and D. A. Peterson.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $1.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1101, December, 1980. 13 p, 6 Fig, 16 Ref.

Descriptors: *Invertebrates, *Streams, *Wyoming, *Aquatic drift, Mayflies, Midges, Baseflow, Runoff, Peak discharge, Powder River(WY), Clear Creek(WY), Behavioral drift, Catastrophic drift.

Invertebrate drift samples were collected in August 1977 from two streams in the Powder River structural basin in northeastern Wyoming. The streams are Clear Creek, a mountain stream, and the Little Powder River, a plains stream. Two major patterns of drift were recognized. Clear Creek was sampled during a period of normal seasonal conditions. High drift rates occurred during the night indicating a behavioral drift pattern that is related to the benthic invertebrate density and carrying capacity of the stream substrates. The mayfly genes Baetis, a common drift organism, dominated the peak periods of drift in Clear Creek. The Little Powder River has a high discharge during the study period. Midge larvae of the families Chironomidae and Ceratopogonidae, ususally not common in drift, dominated the drift community. The dominance of midge larvae, the presence of several other organisms not common in drift, and the high discharge during the study period caused a catastrophic drift pattern. (USGS)

FLOOD FREQUENCY MODELING AND OUTLIERS,
Illinois State Water Survey, Urbana.
K. P. Singh.
In: Proceedings of the Specialty Conference on Computer and Physical Modeling in Hydraulic Engineering, ASCE/August 6-8, 1980, Chicago. p 74-85 (1980). 10 Ref.

Descriptors: *Illinois, *Flood frequency, *Standard deviation, *Statistical methods, Flood flow, Flood data, Flood profiles, Flood recurrence interval, Flood forecasting, Flood basins, Flood peak, Model studies, Flood plains.

The U.S. Water Resources Council recommends a methodology to promote uniform, consistent and accurate techniques for determining flood-flow frequency. Using the Sangamon River basin in central Illinois to illustrate the effects of various factors on flood frequencies, this report analyzes the Council's procedure with emphasis on the detection of outliers---the observations in a set of data that

appear to be inconsistent with the remainder of the data. The report concludes that the criterion for low flood outliers is too severe, resulting in low values (algebraically) of skew. A methodology is developed and applied to modify low and/or high outliers; statistics of storms producing floods perceived as high outliers, and the associated antecedent soil moisture conditions, can be used for confirming high outliers. It is suggested that the Council's methodology for regionalization of skew values can be more precise and meaningful if the outliers are modified before analyzing the flood series. The statistically best plotting position was found to be superior to the Weibull plotting position for testing the goodness of fit of the derived flood distribution curve and the observed floods. SELECTED WATER-LEVEL RECORDS FOR OKLAHOMA, 1979-80,
Geological Survey, Oklahoma City, OK. Water Resources Div.
W. B. Mills, and D. E. Spiser.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $7.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-975, November 1980. 55 p, 1 Fig, 1 Tab.

Descriptors: *Oklahoma, *Water wells, *Water levels, *Aquifers, Water levels fluctuations, Basic data collections.

A systematic program to collect water-level records in Oklahoma began in 1937. The objectives of this program are (1) to provide long-term records of water-level fluctuations in representative wells, (2) to facilitate the prediction of water-level trends and indicate future availability of groundwater supplies, and (3) to provide information for use in basic research. This report includes water-level data from wells measured annually, prior to the irrigation season, to achieve the most natural representation of the static water level; and the counties and number of wells there in, where data were obtained.

GEOHYDROLOGY OF THE DELTA-CLEARWATER AREA, ALASKA,
Geological Survey, Anchorage, AK. Water Resources Div.
D. E. Wilcox.
Geological Survey Water-Resources Investigations 80-92, 1980. 26 p, 13 Fig, 4 Tab, 14 Ref.

Descriptors: *Hydrogeology, *Groundwater, *Aquifers, *Surface-groundwater relationships, *Alaska, Areal hydrogeology, Aquifer characteristics, Water levels, Potentiometric level, Groundwater recharge, Groundwater movement, Water wells, Water yield, Influent streams, Discharge(Water), Water quality, Planning, Hydrographs, *Delta-Clearwater area.

The alluvial aquifer in the Delta-Clearwater area, Alaska, is composed of lenticular, interbedded deposits of silt, sand, and gravel. Ground water occurs under both confined and unconfined conditions in the area. The potentiometric surface slopes approximately northward at gradients ranging from about 1 to 25 feet per mile. The aquifer is recharge by seepage through the streambeds of rivers and creeks and by infiltration of precipitation. Water is discharged from the aquifer into the Clearwater Creek network and Clearwater Lake, which are almost entirely spring-fed, at the mouth of the Delta River, and into the Tanana River along the northern boundary of the study area. Year-round ground-water discharge from the aquifer is estimated to exceed 1,200 cubic feet per second. The following ground-water flow system is hypothesized: Channel losses from the Gerstle River, several small creeks draining the Alaska Range, and the Tanana River to the east of Clearwater Creek recharge the sections of the aquifer discharging at the Clearwater Creek network. Channel losses from the Delta River and Jarvis Creek are the main source of recharge to the sections of the aquifer discharging in the vicinity of Clearwater Lake and Big Delta. Additional work is needed to verify these hypotheses. (USGS)

GROUNDWATER HYDROLOGY OF JAMES CITY COUNTY, VIRGINIA,
Geological Survey, Richmond, VA. Water Resources Div.
J. F. Harsh.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO. 80225, Price: $21.25 in paper copy, $5.50 in microfiche. Geological Survey Open-File Report 80-961 (WRI), September, 1980. 73 p, 22 Fig, 4 Plates, 6 Tab, 32 Ref.

Descriptors: *Groundwater resources, *Sand aquifers, *Aquifer characteristics, *Coastal Plains, *Virginia, Hydrogeology, Groundwater availability, Groundwater movement, Potentiometric level, Water quality, Saline water-freshwater interfaces, Water resources development, *James City County.

Urbanization and increase in water demand prompted a 2-year study of groundwater availability and quality in the county of James City. The coastal-plain sediments, parts of which underlie the county, are the largest source of groundwater in Virginia. Four aquifers form the complex aquifer system. Hydraulic characteristics vary from aquifer to aquifer and from place to place. The Cretaceous aquifer furnishes nearly all the water for industrial and municipal needs. Movement of water in the Cretaceous aquifer is toward cones of depression formed by pumping centers at Williamsburg and Dow Badische Co. All aquifers contain water that generally meets State standards for drinking water. Water in the Cretaceous aquifer is of the sodium chloride bicarbonate type. As depth of aquifer increases, the concentrations of dissolved solids and chloride also increase. Saline water (more than 250 milligrams per liter) occupies the deeper parts of the confined aquifers. The amount of water stored in the coastal sediments is estimated to be 650-1300 billion gallons. An increase in pumpage to accomodate the expected daily demand of 9.8 million gallons per day in year 2000 is feasible provided pumpage is distributed over the county. (USGS)

RELATIONSHIPS BETWEEN BASIC SOILS-ENGINEERING EQUATIONS AND BASIC GROUND-WATER FLOW EQUATIONS,
Geological Survey, Lawrence, KS. Water Resources Div.
D. G. Jorgensen.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.50. Geological Survey Water-Supply Paper 2064, 1980. 40 p, 9 Fig, 1 Tab, 41 Ref.

Descriptors: Groundwater, *Soil engineering, *Equations, *Groundwater movement, Porosity, Void ratio, Compressibility, Consolidation, Storage, Soil compaction, Hydraulic conductivity, Unsteady flow, Modulus of elasticity.

Equations for the Terzaghi theory of consolidation and equations for ground-water flow are identical under specific conditions. A combination of the two sets of equations relates porosity to void ratio, and relates the modulus of elasticity to the coefficient of compressibility, coefficient of volume compressibility, compression index, coefficient of consolidation, specific storage, and ultimate compaction. Also transient ground-water flow is related to coefficient of consolidation, rate of soil compaction, and hydraulic conductivity. Examples show that soils engineering data and concepts are useful to solution of problems in ground-water hydrology. The many varied but related terms developed by ground-water hydrologists and soils engineers are useful to each discipline, but the difference in concepts hinders the use of related terms in interdisciplinary studies. AIRCRAFT REMOTE SENSING OF SOIL MOISTURE AND HYDROLOGIC PARAMETERS, CHICKASHA, OKLA., AND RIESEL, TEX., 1978 DATA REPORT,
Science and Education Administration, Beltsville, MD. Hydrology Lab.
T. J. Jackson, T. J. Schmugge, G. C. Coleman, C. Richardson, and A. Chang.
Agricultural Research Results ARR-NE-8, August 1980. 52 p, 18 Fig, 29 Tab, 1 Append.

Descriptors: *Remote sensing, *Soil water, *Aerial photography, *Infrared imagery, Rainfall, Semiarid lands, Data acquisition, Soil moisture retention.

Experiments were designed and conducted to develop a data set for the analysis of relationships between remote sensing data and hydrologic variables and parameters. The data were collected on May 1, 12, and 30, 1978 in two semiarid areas, Chickasha, Oklahoma and Riesel, Texas. The NASA 929 aircraft was the sensor platform used in these experiments. A nominal altitude of 305 m and a ground speed of 278 km/hour were chosen. The systems used were: color infrared photography, a modular multispectral scanner, a thermal infrared radiometer, multifrequency microwave radiometers, (a passive microwave scanner and multifrequency active microwave scatterometers). Ground observations of soil moisture, pan evaporation, daily maximum and minimum temperatures, and daily rainfall were made in both areas. This particular series was considered successful. However, additional experiments are needed to cover a wider range of soil moisture conditions within semiarid areas. (Moore-SRC)

RESULTS OF A JOINT USA/USSR HYDRODYNAMIC MODELING PROJECT FOR LAKE BAIKAL,
Environmental Research Lab.-Duluth, Grosse Ile, MI. Large Lakes Research Station.
J. F. Paul, A. B. Gorstko, and A. A. Matveyev.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche.
In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Mangement, August 27-30, 1979, Bloomfield Hills, Michigan. Environmental Protection Agency Report 600/9-80-033, July 1980. p 129-155, 1

Descriptors: *Water circulation, *Hydrodynamics, *Suspended solids, *Dissolved solids, Turbulent flow, Water currents, Wind-driven currents, International agreements, Phosphates, *Mathematical models, Lake Baikal, *Russia.

Project 02.02-12, Protection and Management of Water Quality in Lakes and Estuaries, was initiated as part of the USA/USSR Agreement on Cooperation in the Field of Environmental Protection of 1972. Scientists of the two countries compared formulations and results of hydrodynamic and transport models to provide a basis for further verification of lakewide and nearshore models. The model developed has two components, the basic hydrodynamic calculation and the dispersion of dissolved and/or suspended material. The equations for the hydrodynamic component are derived from the time-dependent, three-dimensional equations for conservation of mass, momentum, and energy. The transport and dispersion of material in the turbulent flow is described in a manner similar to that used for the transport and turbulent dispersion of heat and momentum. Surface currents are calculated in relation to wind direction; the model was in good agreement with observed values. Using the steady-state currents that were calculated, the transport and dispersion of phosphate ion and total suspended solids were calculated for each of the four main wind directions. The calculated distributions were in general agreement with observed data. (Brambley-SRC)

A MULTI-LAYERED NESTED GRID MODEL OF LAKE SUPERIOR,
Minnesota Univ., Duluth. Dept. of Physics.
G. J. Oman, and M. Sydor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche.
In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models of Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980. p 207-236, 15 Fig, 42 Ref, 1 Append.

Descriptors: *Mathematical models, *Lake Superior, *Water circulation, Lakes, Hydrological models, Limnology, Model studies, *Bathymetry, Thermal stratification, Remote sensing, Satellite technology.

The size and complex bathymetry of Lake Superior pose serious obstacles when attempting to understand lake dynamics. An understanding of the physical processes occurring in Lake Superior will probably best be achieved by means of numerical modeling in conjunction with remote sensing data and direct measurements made on the lake. Existing three-dimensional Great Lakes models were reviewed to find an appropriate model for Lake Superior. The decision was made to first develop and verify an isothermal model before dealing with the much more difficult task of simulating stratified flows. The Lake Superior model is similar to Leendertse's estuary model. It ignores vertical accelerations and assumes pressure varies hydrostatically. It has a free surface, and uses constant eddy coefficients to represent vertical and horizontal diffusion. Horizontal and vertical advection of momentum are represented using an energy conserving formulation. Centered space differences are used for all terms. In order to assure adequate spatial solution in regions of interest, a nested grid model is used. The complex bathymetry and highly variable thermal structure of Lake Superior can be handled more conveniently with layers of fixed depth, letting only the bottom layer vary in thickness. The model was run for 24 hour periods for easterly and westerly winds on Lake Superior, and on a 2.5 km nested subgrid in extreme western Lake Superior. Results are consistent with Landsat observations. (Moore-SRC)

In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80, p 366-378. 5 Fig, 15 Ref.

Descriptors: *Aquatic environment, *Model studies, *Seasonal distribution, *Ecosystems, *Lakes Hydrologic systems, Phytoplankton, Zooplankton, Water circulation, Bacteria, Nutrients, Detritus, Mathematical models, Solar radiation, Water temperature, Organic matter, Water quality, Lake Baikal, *Russia.

A model of the seasonal dynamics of the pelagic ecosystem of Lake Baikal, USSR, is described, the main components of which are the phytoplankton, zooplankton, bacteria, nutrients and detritus. The surface of the lake is arbitrarily divided into 65 areas of equal size, and the volumes of water divided into two zones: the photosynthetic and destructive zones. The input functions of time include absorbed solar radiation, water temperature, and the inputs of organic matter from the largest sources of the lake. In calculating the status vector of an ecosystem, biologic and hydrologic processes are considered in each step. The redistribution of dissolved and suspended matter within the mass of water is performed in the model by means of horizontal advection and vertical turbulent mixing. The speed and direction of horizontal transfer in each region are constant throughout the year and correspond to the overall system of water circulation in the lake. The turbulent flows are proportional to the vertical gradients of matter. On the whole, the dynamics of spatial distribution of plankton demonstrated by the model agree well with the data of actual surveys made in Lake Baikal. One major advantage of the model is the fact that it enables the tracing of the path of propagation of matter entering the lake, and considers its transformation in the biological system. (Moore-SRC)

A TWO-MODE FREE-SURFACE NUMERICAL MODEL FOR THE THREE-DIMENSIONAL TIME-DEPENDENT CURRENTS IN LARGE LAKES,
Case Western Reserve Univ., Cleveland, OH.
Y. P. Sheng, and W. Lick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-197809, Price codes: A04 in paper copy, A01 in microfiche.
Environmental Protection Agency Report EPA-600/3-80-047, May 1980. 70 p, 29 Fig, 34 Ref, 2 Append. R-803704.

Descriptors: *Model studies, *Mathematical models, *Water currents, *Lake Erie, Vertical flow, Wind-driven currents, Prediction, Free-surfaces, Mathematical analysis, Hydrologic models.

Since Lake Erie is the shallowest of the Great Lakes, the effects of vertical diffusion and bottom shear stress are more pronounced than in the other

Great Lakes. The numerical stability criterion associated with the vertical diffusion terms in the governing equations is also much more stringent. To resolve this problem a two-mode, free-surface model based on vertically-stretched coordinates and a vertically-implicit scheme has been developed and applied to Lake Erie under non-stratified conditions. A brief description of the general equations and boundary conditions is first given. The detailed equations for a two-mode, free-surface model are then described. Finite-difference procedures including the finite-difference equations are listed in detail. The model is first applied to idealized basins and then to Lake Erie for two wind conditions; a uniform wind suddenly imposed, and an actual wind variable in both space and time. The results of the computations are compared with the results from a single-mode, free-surface model and from a rigid-lid model. The surface elevations compare well with those computed by a single-mode free-surface model. The currents as predicted by the rigid-lid model are generally smaller than those predicted by the free-surface model. The present model requires more computer time than does a rigid-lid model but less than a single-mode free-surface model, and is superior to the rigid-lid model in that it does not eliminate currents associated with free-surface oscillations. (Brambley-SRC)
W81-02778

PHYSICAL, CHEMICAL, AND BIOLOGICAL CHARACTERISTICS OF LAKE ELLYN SEDIMENTS.
Illinois State Water Survey, Urbana.
Progress Report to the Northeastern Illinois Planning Commission, SWS Contract Report 243, (1980) 20 p, 1 Fig, 11 Tab, 4 Ref.

Descriptors: *Illinois, *Lake sediments, *Water analysis, Chemical analysis, Macroinvertebrates, Chemical sludge, Sediment yield, Lake soils, Storm runoff, Storm drainage, Storm water, Urban runoff, Surface runoff, Heavy metals, Chemical properties, Physical properties, Biological properties.

As part of the major efforts undertaken by the Northeastern Illinois Planning Commission under the National Urban Runoff Program to evaluate the water quality effects of storm water detention storage, the Water Quality Section of the Illinois State Water Survey carried out field and laboratory investigations to characterize the physical, chemical, and biological nature of the bottom sediments of Lake Ellyn. Five field sampling trips during 1979-1980, and subsequent laboratory analyses, provided the following results. In the physical characteristics category, sediment moisture content at station No 1 was found to be the lowest, progressively increasing toward the outlet; the volatile fraction of the solids was the highest at the inlet, but decreased progressively toward the outlet. No discernible trend in particle size distribution was found. For chemical characteristics, concentrations of chromium, copper, iron, lead, mercury and zinc were found in all sediment samples, as determined by atomic absorption spectroscopy. Arsenic and chromium concentrations were determined by the Inductively Coupled Plasma (ICP) method. The report also lists pH, various forms of nitrogen, total phosphorus, and grease and oil found in the sediments. Under biological characteristics, the predominant benthic organisms in Lake Ellyn were found to be Chaoborus and Chironomidae, which are essentially pollution-tolerant. (Garrison-Omniplan)

TURNOVER RATE OF DISSOLVED ORGANIC MATERIALS IN GLACIALLY-OLIGOTROPHIC AND DYSTROPHIC LAKES IN BRITISH COLUMBIA, CANADA,
Tsukuba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, K. S. Shortreed, and J. G. Stockner.
Archiv fur Hydrobiolgie, Vol 90, No 2, p 210-216, October, 1980. 1 Fig, 2 Tab, 11 Ref.

Descriptors: *Oligotrophy, *Organic matter, *Lakes, Dystrophy, Trophic level, Eutrophication, Lake stages, Canada, *British Columbia.

Glacial and dystrophic lakes located in British Columbia were used to study the dynamics of dissolved organic materials. The study was conducted during the summer stratification period in 1979. All the lakes studied had low levels of one or more of the basic algal nutrients. Common features of rapid flushing, low base nutrient load and weak stratification with deep mixing throughout the year have contributed to the lakes' oligotrophic status. In dystrophic Lowe and Bonilla lakes the concentrations of both nitrogen and phosphorus are low, and distinct summer depletion of epilimnetic nitrogen occurred. In the surface of all glacial and dystrophic lakes, freshwater microorganisms with an optimum activity of 0.5% salinity were predominant, even though microorganisms in the glacial lakes showed a more euryhaline characteristic than those in the dystrophic lakes. The concentrations of amino acids and carbohydrates in situ in the lakes were mostly one order of magnitude lower than those in eutrophic watermasses, but those of organic acids were of almost the same level as those in eutrophic watermasses. MOLECULAR WEIGHT DISTRIBUTION AND CHARACTERIZATION OF DISSOLVED ORGANIC MATTER FROM LAKE WATERS,
Nagoya Univ. (Japan). Water Research Inst.
T. Hama, and N. Handa.
Archiv fur Hydrobiologie, Vol 90, No 1, p 106-120, September, 1980. 5 Fig, 4 Tab, 41 Ref.

Descriptors: *Lakes, *Organic matter, Carbohydrates, Amino acids, Proteins, Solutes, Dissolved organic carbon, *Japan.

The molecular weight distributions of dissolved organic carbon (DOC), dissolved carbohydrates, amino acids, proteins, and organic acids in samples from three lakes in Japan were investigated with the aid of Sephadex G-25 gel filtration. DOC consisted to a considerable extent of low molecular weight organic materials in all of the water samples studied. Carbohydrates consisted of mainly high molecular weight polymers, while amino acids and proteins were distributed evenly in low through high molecular weight fractions, without any dramatic change in the concentration. Volatile organic acids were only found in the low molecular weight fraction. These organic compounds accounted for 16.5-20.6% of the DOC, thus more than 80% of the DOC was left undetermined. THE MACROBENTHOS OF LAKES ROTOROA AND ROTOITI, SOUTH ISLAND, NEW ZELAND, WITH SPECIAL REFERENCE TO THE INFLUENCE OF ALLOCHTHONOUS ORGANIC DETRITUS,
Canterbury Univ., Christchurch (New Zealand). Dept. of Zoology.
B. V. Timms.
Archiv fur Hydrobiologie, Vol 90, No 2, p 182-196, October, 1980. 4 Fig, 4 Tab, 24 Ref.

Descriptors: *Benthos, *Lakes, Lake Rotoroa, Lake Rotoiti, *New Zealand, Decomposing organic matter, Distribution patterns, Glacial lakes, Mesotrophy, Aquatic productivity.

The mesotrophic glacial lakes, Lakes Rotoroa and Rotoiti, have substrates enriched at their southern inflow ends by natural allochthonous organic debris. Twenty macrobenthic species were found in Lake Rotoroa and 25 in Lake Rotoiti. The following species were numerous in both lakes: Lumbriculus variegatus, Limnodrilus hoffmeisteri, Phreodrilus spp., Macropelopia spp., Chironomus spp., Potamopyrgus antipodarum, and Sphaerium novaezealandiae. It is suggested that this low number of different species is largely caused by a combination of zoogeographic isolation and the lack of distinct seasonal markers in a climate background known for its vagrancies, thereby providing few reliable environmental cues. Standing crops were unexpectedly high in each lake, but particularly so in Lake Rotoroa, for lakes considered to be mesotrophic. Observation of the area would suggest that there is considerable natural input of organic detritus, mainly beech leaves and twigs. (Baker-FRC)

RELATIONSHIP BETWEEN HETEROTROPHIC BACTERIA AND PHYTOPLANKTON IN LAKE MERGOZZO AND LAKE BIWA,
Kyoto Univ. (Japan). Dept. of Fisheries.
Y. Ishida, M. Nakaji, and H. Kadota.
Archiv fur Hydrobiologie, Vol 88, No 4, p 450-457, June, 1980. 4 Fig, 1 Tab, 6 Ref.

Descriptors: *Bacteria, *Lake morphology, *Lake morphometry, Hypolimnion, Eutrophication, Microorganisms, Aquatic bacteria, Limnology, Lakes, *Japan, Lake Mergozzo, Lake Biwa.

Water samples collected from various depths in Lake Mergozzo and Lake Biwa were filtered through 5 micron mesh nets, and the relationships between phytoplankton and the L-bacteria in whole water and those attached to the particles larger than 5 micron in diameter were determined. The number of L-bacteria grown on nutrient-poor medium was always considerably larger than that of H-bacteria grown on nutrient-rich medium when compared with the whole water body. Particularly in the hypolimnion, a larger percentage of L-bacteria was present in particles larger than 5 micron. The findings support the theory that the L-bacteria attach to phytoplankton and its debris and are carried by them from epilimnion to hypolimnion through metalimnion. It is also suggested that phytoplankton are significant factors in the production in lake water of bacteria, especially L-bacteria, by supplying, them with solid surface to which to attach themselves. L-bacterial populations appeared most strongly assoicated with particles larger than 5 microns. It is concluded that L-bacteria often dominate in lake waters, especially in oligotrophic lakes. FIELD DATA DESCRIBING THE MOVEMENT AND STORAGE OF SEDIMENT IN THE EAST FORK RIVER, WYOMING. PART I. RIVER HYDRAULICS AND SEDIMENT TRANSPORT, 1979,
Geological Survey, Denver, CO. Water Resources Div.
W. W. Emmett, R. M. Myrick, and R. H. Meade.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $6.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1189, 1980. 43 p, 2 Fig, 19 Tab, 14 Ref.

Descriptors: *Sediment transport, Rivers, *Streamflow, *Fluvial sediments, *Wyoming, Bed load, Bed load samples, Sediment discharge, Particle size, Sedimentation rates, Stage-discharge relations, Data collections, *East Fork River(WY), Helley-Smith bedload sampler.

Bed-material gradation and water-surface slope were determined for a 3.3-kilometer reach of East Fork River, Wyo. During peak snowmelt runoff, frequent measurements of water discharge and sediment-transport rate provided data describing

the inflow and outflow of water and sediment. In spring 1979, bankfull stage was exceeded on 8 days. Maximum discharge was about 32 cubic meters per second, which has a recurrence interval of about 2 years. The median particle size of bed material is 1.28 millimeters; the 35 and 65 percentiles are represented by diameters of 0.50 and 2.88 millimeters, respectively. The average water-surface slope in the reach is 0.0007 and varies little with river stage. Bedload-transport rates ranged from a little less than 0.001 to a little more than 0.1 kilograms per meter of channel width per second. Median bedload grain size, with several exceptions, ranged from 0.4 to 1.5 millimeters. Gravel-size particles generally constituted 10 to 40% of the bedload. Suspended-sediment concentrations ranged from 6 to 95 milligrams per liter. Suspended sediment smaller than sand constited about half the measured suspended sediment, ranging from 17 to 81%. (USGS)

BANK EROSION OF THE ILLINOIS RIVER,
Illinois State Water Survey, Urbana.
N. G. Bhowmik, and R. J. Schicht.
Illinois Institute of Natural Resources, Report of Investigation 92, 1980. 52 p, 27 Fig, 7 Tab, 20 Ref.

Descriptors: *Illinois, *Bank erosion, Flow velocity, *Rivers, *Stream banks, Bed sediment, Erosion control, Silting, Sedimentation, Sediment load, Waves, Wind erosion, Lake breezes, Lake sediments, Reach, *Illinois River.

As part of a 5-year study to determine the effects of increased Lake Michigan diversion on water quality of the Illinois River and on its susceptibility to additional flooding, bank erosion was investigated by making a field inspection from Joliet to Grafton. It was found, in general, that the silty, sandy, and clayey materials of these severely eroded banks should be stable against the action of tractive force and flow velocity. However, preliminary computations indicated that the banks are unstable as far as the wind-generated wave action is concerned. It is suspected that river traffic-generated wave action also has a similar effect. Extensive bed and bank material samples were collected and grain size distributions were determined. After developing plan views of twenty selected sites, the bank slopes at these reaches were determined and the stability of the banks at all twenty locations was tested and anlyzed. As far as the flow hydraulics are concerned, bank erosion will not be affected by the proposed increase in diversion. A monitoring program is outlined and future research on wave action is suggested. Bank erosion attracts public attention, reduces property value, results in permanent loss of real estate, increases stream turbidity, and accelerates the silting of reservoirs or backwater lakes along the stream course. DYNAMICS OF SEDIMENT AND ORGANIC DETRITUS IN A SMALL CHALK STREAM,
Freshwater Biological Association, Dorset (England). River Lab.
J. S. Welton.
Archiv fur Hydrobiologie, Vol 90, No 2, p 162-181, October, 1980. 11 Fig, 5 Tab, 33 Ref.

Descriptors: *Detritus, *Erosion, Streams, Sediments, Nutrients, Decomposing organic matter.

A study was made of the seasonal variation in amounts of detritus present in a small chalk stream in relation to the changes in macrophyte cover and community composition. The origin of the detritus present was studied, along with the accumulation rates of detritus in different parts of the stream. The maximum discharge was noted to occur during the autumn or winter. Other marginal vegetation showed a similar seasonal pattern. Detritus volume increased by 500% over the study period, corresponding to increased marginal vegetation caused by the cessation of bankside trimming and the generally low discharges occurring in 1973 and 1974. The analysis of collected sediment showed a decrease in size during the summer as the water velocity decreased, the sand became less dominant, and the fecal material increased. A decrease was noted in the percentage of organic content as the size fraction became smaller, and the organic content was lower in winter than in summer. (Baker-FRC)

SELECTED CHEMICAL QUALITY CHARACTERISTICS IN STREAMS OF KENTUCKY, 1970-75.
Geological Survey, Louisville, KY. Water Resources Div.
Geological Survey Water-Resources Investigations 79-21 (open-file report), 1980. 1 Sheet, 10 Ref. (Santos, J. F., complier).

Descriptors: *Water quality, Chemical reactions, *Streamflow, *Groundwater, *Kentucky, Data collections, Dissolved solids, Hardness(Water), Nitrates, Maps.

Generalized maps of average dissolved solids, hardness and nitrate concentrations of water in streams throughout Kentucky were prepared from data collected at more than 100 sites from 1970 to 1975. Average dissolved solids concentrations seldom exceed 250 milligrams per liter. Hardness, mostly of calcium magnesium origin, generally ranges from 60 to 180 milligrams per liter. Average nitrate concentrations exceed 2 milligrams per liter at most of the sites. (USGS)

SPECIES DEPENDENT MASS TRANSPORT AND CHEMICAL EQUILIBRIA: APPLICATION TO CHESAPEAKE BAY SEDIMENTS,
Manhattan Coll., Bronx, NY. Environmental Engineering and Science Program.
D. M. Di Toro.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, Michigan. Environmental Protection Agency Report EPA 600/9-80-033, July 1980. p 85-12

Descriptors: *Mass transfer, *Chemical reactions, *Bottom sediments, Anions, Cations, *Chesapeake Bay, Equilibrium, Gases, Alkalinity, Interstitial water, Mathematical analysis.

A comprehensive analysis is necessary in order to understand the interrelationships between sediments and interstitial waters, and to establish the primary controlling factors. Equations of mass balance and chemical eequilibrium are combined into a single structure for the analysis of sediment interstitial water and gas phase concentrations. For the Chesapeake Bay station analyzed it appears to be a reasonable approximation to compute the distribution of the species with the components C, H, O, and S using the requirements of chemical equilibrium, but not the nitrogen species. The gas phase-aqueous phase reactions at equilibrium correspond to the case of slow gas phase motion. For species dependent transport the computations reproduce the major features of the observed data as well as the more detailed variations of the C to N ratio and the net alkalinity. The computational framework provides the means for examining the relative impact of various mechanisms that affect net alkalinity and the other species. For more complete analysis a very comprehensive data set is required, including not only the complete interstitial water chemistry but also a detailed analysis of the sediment solid phases, with both organic material and inorganic phases characterized. CHEMICAL AND PHYSICAL CHARACTERISTICS OF WATER IN ESTUARIES OF TEXAS, OCTOBER 1974-SEPTEMBER 1975,
Geological Survey, Houston, TX. Water Resources Div.
W. B. Lind.
Texas Department of Water Resources Report 245, April 1980. 291 p, 13 Fig, 9 Tab, 13 Ref.

Descriptors: *Chemical properties, *Physical properties, *Water quality, *Estuaries, *Texas, Data collections, Sampling, Sites, Water analysis, Chemical analysis, Organic compounds, Inorganic compounds, Trace elements, Nutrients, Insecticides, Bacteria, Coliforms, Chlorophyll.

Approximately 290 data-collection sites were visited in estuaries of Texas during the 1975 water year. At each data-collection site, field data are collected from several points along a vertical. Samples for laboratory analyses are collected from a predetermined number of data-collection sites and at other sites in the network when significant changes in field data indicate a need for additional samples. Properties or constituents measured in the field are dissolved oxygen, specific conductance, temperature, pH, transparency by Secchi disk, and turbidity. Laboratory analyses include the principal inorganic ions, biochemical oxygen demand, phenols, total organic carbon, dissolved organic carbon, suspended organic carbon, chlorophyll, coliform and streptococci bacteria, insecticides and herbicides, ammonium, nitrite, nitrate, ortho and total phosphate, and other selected ions such as aluminum, arsenic, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, nickel, strontium, and zinc. VEGETATIVE PROPAGATION OF SOME SAPROLEGNIACEAE UNDER SIMULATED-ESTUARINE-CULTURE CONDITIONS,
North Carolina Univ. at Wilmington. Dept. of Biology.
D. E. Padgett.
Mycologia, Vol 72, No 2, p 410-415, 1980. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Fungi, *Aquatic fungi, *Estuaries, Saline water, Microbiology, Microorganisms, Laboratory tests, Vegetation propagation.

Laboratory studies of saprolegniaceous fungi demonstrated that vegetative propagation occurred under simulated estuarine salinity cycles which do not permit asexual sporulation. Mycelial macerates of Achyla americana did not infect fresh bait in a 1

to 10 ppt salinity cycle. The two isolates of A. flagellata differed in behavior. Isolate 66 produced infestation in 1 to 10 ppt cycling; Isolate 67 propagated in 0 to 10 and 3 to 12 ppt salinity. Saprolegnia parasitica infested bait in 0 to 10 and 3 to 12 regimes; Thraustotheca clavata, in 0 to 12, 3 to 15, 5 to 18 ppt cycles. Therefore, saline waters may not necessarily prevent propagation of water molds. (Cassar-FRC)

FACTORS INFLUENCING PARTICULATE MATTER GEOCHEMISTRY IN THE ST. LAWRENCE ESTUARY TURBIDITY MAXIMUM,
Quebec Univ., Rimouski. Dept. of Oceanographic.
C. Gobeil, B. Sundby, and N. Silverberg.
Marine Chemistry, Vol 10, No 2, p 123-140, 1981. 8 Fig, 3 Tab, 45 Ref.

Descriptors: *St. Lawrence River, *Turbidity, *Sediments, Salinity, *Estuaries, *Geochemistry, Water properties, Particulate matter.

A field study is presented of the variations in the elemental composition of suspended matter and sediment in the St. Lawrence river and estuary. Water samples were taken during May and November of 1976 at periods of high and low river discharge, respectively. Suspended particulate matter was sampled 635 times. An abrupt change in elemental composition was noted when traversing the front at the landward edge of the turbidity maximum. There appeared to be no relationship between salinity and elemental composition. The data collected clearly demonstrate the importance of estuaries in influencing the geochemistry of particulate matter accumulating and passing through. Among the important processes are diagenetic mobilization within the fine-grained sediments, early settling of the coarse-grained components and further size sorting within the turbidity maximum, and depletion of certain elements from the sediment and their export out of the estuary. (Baker-FRC)

ESTUARINE FISH COMMUNITIES OF THE EASTERN JAMES-HUDSON BAY COAST,
Laval Univ., Quebec. Centre d'Etudes Nordiques.
R. Morin, J. Dodson, and G. Power.
Environmental Biology of Fishes, Vol 5, No 2, p 135-141, April, 1980. 1 Fig, 5 Tab, 31 Ref.

Descriptors: *Estuaries, *Fish populations, *Hudson Bay, *James Bay, Canada, Saline water fish, Brackish water fish, Marine fish, Cold water fish, Fish types, Fish taxonomy, Fish barriers, Aquatic habitats, Distribution patterns.

Fish distribution was studied in 6 estuaries along 900 km and 7 degrees latitude on the east coast of James and Hudson Bays between 1973 and 1977. A total of 15 families and 38 species were found, 35 species in the estuaries and rivers of James Bay, the more southern water, and 24 in those of Hudson Bay. Freshwater species were reduced toward the north, euryhaline species being favored. Marine species, arctic and subarctic, accounted for less than a third of inshore fish, and were rare in estuaries of the southernmost water studied. Freshwater species may be less plentiful in the north because of the more rigorous climate, failure to penetrate beyond certain watersheds in the postglacial dispersion, and the limited distances to the first fish barrier in northern rivers. (Cassar-FRC)

NITROGEN AND PHOSPHORUS DISTRIBUTION AND UTILIZATION BY SPARTINA ALTERNIFLORA IN A LOUISIANA GULF COAST MARSH,
Louisiana State Univ., Baton Rouge. Lab. for Wetland Soils and Sediments.
R. J. Buresh, R. D. DeLaune, and W. H. Patrick, Jr.
Estuaries, Vol 3, No 2, p 111-121, June, 1980. 6 Fig, 2 Tab, 33 Ref.

Descriptors: *Nitrogen cycle, *Phosphorus compounds, *Salt marshes, Spartina alterniflora, Plant growth, Nutrients, *Louisana, *Estuaries, Water pollution effects, Path of pollutants, Nitrogen compounds, Phosphorus, Ammonium compounds, Wetlands, Coastal marshes, Marshes, Biomass, Soil chemical properties.

Nitrogen and phosphorus contents of Spartina alterniflora and soil nitrogen were studied along a 23 meter transect perpendicular to a stream in a Louisiana salt marsh. In June and September total N and P in plants were greater near the stream than at inland sites. Soil N varied from 0.43% 1.5 meters from the stream to 0.86% at 23 meters inland. Sediment N was 0.55%. Extractable ammonia-N levels in the sediment were 22.5 micrograms per gram (dry soil weight basis); 40-45 micrograms per gram 20 meters from the stream in the presence of sparse vegetation; and 4-7 micrograms per gram at 1.5 to 17 meters from the stream. Addition of labeled ammonia-N at 200 kg per hectare to an inland site increased biomass by 25-28% after four months. The ratio of below-ground plant material to above-ground plant material decreased from 5.7 to 4.7. Added phosphate-P did not significantly change plant height or biomass. About half the N in the above-ground portion of the plants was derived from added ammonia-N. After four months, 28-29% of added labeled N was recovered in the plant tissue, indicating that Spartina may serve as a sink for N entering the wetlands. Soil N was 99% organic, 1% inorganic, and not readily available to the plants. Above-ground plant tissue accounted for only 2% of the total N in the system (plants and soil to a depth of 20 cm), root systems 14%, and soil 84%. (Cassar-FRC)
W81-02840

RATE OF OCCURRENCE OF FALSE-POSITIVE RESULTS FROM TOTAL COLIFORM MOST-PROBABLE-NUMBER ANALYSIS OF SHELLFISH AND ESTUARIES,
Maryland Univ., College Park. Dept. of Microbiology.
D. Hussong, R. R. Colwell, and R. M. Weiner.
Applied and Environmental Microbiology, Vol 40, No 5, p 981-983, November, 1980. 1 Fig, 3 Tab, 15 Ref.

Descriptors: *Estuaries, *Bacterial analysis, *Most probable number test, *Shellfish, *Coliforms, Errors, Temperature, Oysters, Analysis of variance, *Chesapeake Bay.

Chesapeake Bay oysters and oyster beds were examined over a 2-year period to determine the rate of false-positive results from total coliform most-probable-number analysis of shellfish and estuaries. The sampling sites selected were commercially important oyster harvest areas, and the water column of both areas was subject to very little fecal contamination. Salinity and temperature of the water were measured, and a homogenized solution of oysters was prepared. A five-tube, total coliform MPN analysis of water, sediment, and oyster samples indicated that false-positive results were related to water temperature. In the past, total coliform MPN results for cold estuarine water samples were subject to high error. It is recommended that total coliform MPN evaluations of estuarine water, shellfish, and sediment samples include the complete test whenever the water temperature falls below 15 deg C. (Small-FRC)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

HIGH RECOVERY SEED SLURRY REVERSE OSMOSIS DEMONSTRATION FOR DESALTING WATERS SATURATED IN CALCIUM SULFATE.
Resources Conservation Co., Seattle, WA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193989, Price codes: A03 in paper copy, A01 in microfiche. Final Report, Prepared for Office of Water Research and Technology, February, 1981. 40 p, 17 Fig. OWRT-C-00040-D(No 0451)(1), 14-34-0001-0451.

Descriptors: *Desalination, *Reverse osmosis, *Membrane processes, Tubular cellulose acetate membrane, Brackish water desalting, *Calcium sulfate removal, Roswell, New Mexico.

The purpose of this work was to demonstrate the technical feasibility of RCC's patented seeded slurry reverse osmosis process for desalting waters saturated in calcium sulfate. This was carried out by operating a portable seeded RO test unit at the OWRT test facility in Roswell, New Mexico. The field test was conducted in September and October of 1980. This unit was operated for a month at a recovery of 90% or more with no indication of scaling or fouling. It took a feed that was close to saturation with calcium sulfate and concentrated it by a factor of 10. The only pretreatment used was 25 micron filtration, acidification and chlorination. During the test the modules continuously saw a suspended solids level of 15,000 mg/l or more. This demonstrates a unique way of operating a reverse osmosis system and a process for achieving high recovery when operating on waters nearly saturated in slightly soluble salts, e.g., calcium sulfate and silica.

3C. Use Of Water Of Impaired Quality

EVALUATION OF THE IMPACT IMPOSED UPON SURFACE WATER SOURCES BY IMPLEMENTATION OF THE FEDERAL WATER CONSERVATION AND REUSE POLICY IN A RIVER BASIN WITH A WATER SURPLUS,
Eastern Tennessee State Univ., Johnson City. Dept. of Environmental Health.
C. S. Bishop, and R. R. Jacobs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193930, Price codes: A04 in paper copy, A01 in microfiche. University of Tennessee, Knoxville, Tennessee Water Resources Research Center, Research Report No 84, October, 1980. 41 p, 11 Tab, 5 Ref, 1 Append. OWRT-A-061-TENN(1), 14-34-0001-0145.

Descriptors: Federal jurisdiction, Surface water availability, *Water law, *Water quality, *Water reuse, *Water supply, Evaluation, *Model studies, Prediction, Legal aspects, Water quality standards, Water quality management, Potential water supply, Water management, Projections, Forecasting, Estimating, Surface water, Water use, Water conservation, Policy making, River basins, Baseline studies, Tennessee, Washington County.

This study was designed to determine baseline data on water quality in the Washington County, Tennessee section of the French Broad River Basin, and then project the consequences of three water conservation and reuse scenarios on water quality in a water surplus area: (1) no significant water conservation and reuse; (2) 10% water use voluntary reduction; (3) 30% reduction through a governmental program of incentives and regulatory restrictions. Sampling sites were selected to assess effects of non-point and point source inputs on water quality. The Nolichucky River and its tributaries appeared of good water quality; the River was not being used excessively as an industrial/domestic water resource or as a receiving water system for Washington County waste effluents. If the current water level usage continues, the Nolichucky will be able to absorb the negative influences on water quality without water conservation. Also, neither a voluntary 10% reduction nor a mandatory 30% reduction in water use will significantly alter the River water quality. (Zielinski-IPA)

EVALUATION OF INDUSTRIAL COOLING SYSTEMS USING RECLAIMED MUNICIPAL WASTE WATER, APPLICATION FOR POTENTIAL USERS,

Montgomery (James M.), Inc., Pasadena, CA.
R. R. Trussell, G. P. Treweek, K. P. Fox, P. H. Kreft, and G. J. Coulter.
California State Water Resources Control Board, Office of Water Recycling, Sacramento, Report November, 1980. 205 p, 33 Fig, 44 Tab, 39 Ref, 6 Append.

Descriptors: *California, *Waste water reclamation, *Water reclamation, *Water reuse, *Industrial water use, Water cooling, Municipal waste water, Industrial plants, Water use, Industrial water, Waste water treatment, Evaluation, Economic aspects, Cost analysis, *Impaired water use.

Among water-short regions of the country, waste water reclamation and reuse has become an increasingly important resource for meeting additional water needs. Industrial cooling water constitutes the third largest water-use category after agricultural irrigation and process water for manufacturing industries. This report describes the technical feasibility of additional industrial use of reclaimed waste water for cooling systems typically in use in southern California. Water shortages are predicted for southern California in the mid-to-late 1980s. Within the Los Angeles and Orange County areas alone, it is estimated that 96,000 acre-feet per year of municipal waste water could be used for industrial cooling. There is a gap between potential and existing applications in part because of uncertainty about the mechanics and costs of reuse for individual facilities. Several processes are available for treating reclaimed water. Each produces waste material that must be handled. Selection of the appropriate method depends on pretreatment water quality and the availability of adequate waste disposal facilities. Technical, institutional and cost components of industrial water reuse are described. The report analyzes existing reuse facilities and suggests guidelines for industries to use in evaluating their own potential for water reuse. The total annual costs of supply, transport and reuse of 3 million gallons per day(MGD) of reclaimed water for industrial cooling is approximately $1 million. It is suggested that public financing, perhaps as part of local or regional projects, would be appropriate to help fund such projects. (Garrison-Omniplan)

Environmental Conservation, Vol 7, No 4, p 319-324, Winter, 1980. 2 Fig, 4 Tab, 10 Ref.

Descriptors: *Tannery wastes, Saline soils, *Agriculture, Irrigation, *Imparied water use, Soil properties, Land reclamation, Chlorides, Water pollution effects, Sodium, Salinity, Pollutants, Crops, Industrial wastes, Salts, *Wastewater disposal, Reclamation, Ultimate disposal, Disposal, Water quality, *Pakistan.

Highly saline, greenish-blue tannery waste water effluents, which averaged 106.59 milliequivalents per liter Na, 93.3 meq chloride, and 14,000 micromhos per cm electrical conductivity, were used to irrigate crops in fields adjacent to the Firdaus tannery at Muridke, Pakistan. Although rice and mustard seeds did not germinate in soil watered with the pure effluent, they showed 79-80% germination in 3:1 dilution (distilled water:waste water). Farmers generally supplement the small volume of waste water with tube well irrigation. The fields, which were wasteland before tannery operation began, had significantly greater moisture content, water-stable aggregates, water-holding and cation-exchange capacities, quantity of organic matter, and exchangeable Na than a plot of adjacent wasteland. The cropland also had lower electrical conductivity, pH, concentrations of Ca, Mg, soluble Na, chlorides and sulfates, sodium adsorption ratio, and exchangeable Na than the wasteland. Therefore, application of tannery effluent to a very highly saline and sodic wasteland soil improved soil characteristics so that agriculture was eventually possible. However, use on normal soil is likely to create salinity problems. (Cassar-FRC)

WASTE WATER SPRAY TRANSPORT IN LAND APPLICATION,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
N. J. Zimmerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170540, Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1980. 246 p, 23 Fig, 24 Tab, 92 Ref, 8 Append. OWRT-B-104-NC(3).

Descriptors: *Waste water irrigation, *Irrigation, *Spray irrigation, Water use, Aerosols, *Pathogenic bacteria, Microorganisms, Bacteria, *Waste water disposal, Waste water farming, Waste water outfall, Direct irrigation, Land disposal, Spraying, Sprays, Pollution load, Water pollution sources, Pollutants, Bioindicators, Pollutant identification, Fallout, Pathogens.

A small portion of wastewater sprayed in a land irrigation or disposal system will be aerosolized, making possible airborne transport of pathogenic microorganisms. Two spray solutions (one containing Escherichia coli coliform bacteria; the other, a fluorescent dye, uranine) were simultaneously sprayed in an open field to simulate the aerosolized portion of a full-scale irrigation spray. Ambient concentrations were determined up to 300 meters downwind; maximum downwind concentrations being estimated from dye field data for 65 experimental runs. These data plus meteorological data (e.g., solar radiation, relative humidity, temperature, wind speed/direction) were analyzed to develop an appropriate atmospheric dispersion model. Linear regression analysis of all daytime runs gave an empirical model that predicted concentrations for 84% of the data within a factor of two. A bacterial airborne viability model indicated that logarithm bacterial death rate correlated inversely with relative humidity and directly to solar radiation. Evaluation of the overall study indicated low levels of pathogens (about one per cubic meter, 30 meters downwind from spraying). Dose-response infectivity and disease studies are needed to further assess health hazard potential. (Zielinski-IPA)

USE OF CROP CANOPY-AIR TEMPERATURE DIFFERENCE FOR IRRIGATION SCHEDULING,
Minnesota Univ., Minneapolis.
K. M. Geiser, E. R. Allred, and D. C. Slack.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198426, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, March, 1981. University of Minnesota Agricultural Engineering Report Series. 49 p, 4 Fig, 5 Tab, 27 Ref, 5 Append. OWRT-A-037-MINN(2), 14-34-001-0125.

Descriptors: *Irrigation efficiency, Irrigation requirements, *Air temperature, *Crop production, *Corn, *Scheduling, *Multivariate analysis, Irrigation, Irrigation engineering, Irrigation practices, Irrigation programs, Irrigation water, Temperature effects, Temperature, Thermal stress, Water stress, Crop yield, Canopy, Prediction, Regression analysis, Thermometers.

The difference in temperature (DT) between the crop canopy and the air enables an infrared thermometer to be used as a scheduling tool. As water becomes limiting, the crop temperature increases due to the lack of water for cooling by transpiration. The study objectives included development of a model for DT to schedule irrigations, testing the DT model by using it for corn irrigation scheduling in central Minnesota, and evaluating the model by comparison to unirrigated corn (and corn using irrigation scheduling by electric resistance blocks and an evaportranspiration model). Analysis of data (net radiation, wind speed, relative humidity, wet/dry bulb temperatures, available soil moisture and DT) collected over two corn growing seasons, (1978 and 1979 summers) indicated that DT was primarily dependent on net radiation. Multiple linear regression analysis gave an equation expressing DT as a function of available soil water, relative humidity and net radiation, which was used to determine critical temperature differences for initiating corn irrigation during the 1980 growing season. The method compared favorably with other more common irrigation scheduling methods, and indicated reduced water use without significant crop yield reductions. (Zielinski-IPA)

IRRIGATION OF CROPS IN THE SOUTHEASTERN UNITED STATES, PRINCIPLES AND PRACTICE,
Southern Piedmont Conservation Research Center, Watkinsville, GA.
R. R. Bruce, J. L. Chesness, T. C. Keisling, J. E. Pallas, Jr., and D. A. Smittle.
Agricultural Reviews and Manuals ARM-S-9, May 1980. 60 p, 26 Fig, 25 Tab, 59 Ref.

Descriptors: *Irrigation practices, *Soil-water-plant relationships, *Crop production, Plant growth, Farm management, Climates, Fertilizers, Water deficit, Drought, Irrigation requirements, Humid areas, Soil temperature, Soil properties, Drought resistance, Plant physiology, Southeast U.S.

Although the basic relationships of plant growth, soil, and water are applicable in any climate and geographic region, the application of basic principles to particular plant-soil-water systems presents unique problems. The practices associated with irrigated agriculture in arid regions are not appropriate in a humid region like the southeast, where excess water can be as frequent a problem as a water deficit. The primary region of application of this review has soils chiefly classified as Udalfs and Udults existing in the udic water regime and thermic temperature regime. The region has more than 40 inches of mean annual precipitation, with less than 5 inches of absolute water deficit, and a mean annual soil temperature at the 20 inch depth between 59 and 72 degrees F. Most aspects of crop management are discussed in the context of irrigation practice to achieve high yields in this climate and these soils. Variations in drought tolerance among crop species and among cultivars may determine the water regime required for acceptable crop performance. The sensitivity of many crops to drought varies greatly with physiological growth stage. For typical crop, soil, and climate situations, procedures are outlined for selecting irrigation equipment and for operating the equipment to provide the dependable soil-water control necessary for meeting a crop's water needs. In this region, the managing of mobile nutrients deserves particular attention. Since nutrients can easily be applied through the commonly used irrigation systems, crop requirements can be programmed and met simultaneously with water requirements. (Moore-SRC)

4A. Control Of Water On The Surface

BAYES-MARKOV ANALYSIS FOR RAIN-CATCHMENT CISTERNS,
Hawaii Univ., Honolulu. Water Resources Research Center.
Y-S. Fok, R. H. L. Fong, J. Hung, E. T.

Murabayashi, and A. Lo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193963, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 133, March, 1980. 100 p, 26 Fig, 5 Tab. OWRT-A-073-HI(3), 14-34-0001-8013, 9013.

Descriptors: *Cisterns, *Rainfall, *Water demand, *Storage capacity, *Water management(Applied), *Dynamic programming, Water conservation, Droughts, *Hawaii, Water storage, *Bayes-Markov analysis, Rainfall probabilities, Risk analysis, Design methodology, Operational methodology, Pauoa Flats rain gage, Oahu.

In many parts of the world, public water-supply systems have shown signs of an inability to adequately service increasing demand. As a result, water shortages have occurred and moratoriums on new development areas have been imposed. And because of recurrent droughts and the rapid acceleration of urban development in recent years, the rain-catchment system and its cost effectiveness are now regaining the attention of researchers and planners as a 'new' and important alternative water supply. Rainfall, catchment area, storage capacity of the cistern, and water demand are the four main elements considered in the design, operation and management of a cistern system. Expected weekly rainfall is the main uncontrollable element of concern to the cistern owner; therefore, to meet this problem, expected weekly rainfall probabilities were first simulated by the Bayesian analysis. Then the sequential property contained in the 25-yr rainfall record was utilized to generate the likelihood probability function by using the lag 1 Markov sequential analysis. The Bayes-Markov analysis was subsequently applied to obtain the weekly rainfall probabilities. As a result of these analyses, the Bayes-Markov probabilistic approach for weekly rainfall simulation has shown its usefulness. Design and operational methodologies are also presented in the report.

EFFECTS OF THE RATE OF RELEASES FROM SAM RAYBURN RESERVOIR ON THE AERATION CAPACITY OF THE ANGELINA RIVER, EASTERN TEXAS,
Geological Survey, Austin, TX. Water Resources Div.
J. Rawson, R. L. Goss, and I. G. Rathbun.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A094 303, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-58, July, 1980. 23 p, 4 Fig, 5 Tab, 3 Ref.

Descriptors: *Reservoir releases, *Aeration, *Water quality, *Dissolved oxygen, *Texas, Streamflow, Flow rates, Reservoir operation, Data collections, Sites, *Sam Rayburn Reservoir, Angelina River, Time of travel.

A three-phase study was conducted during July and August 1979 to determine the effects of varying release rates through the power-outlet works at Sam Rayburn Reservoir, eastern Texas, on aeration capacity of a 14-mile reach of the Angelina River below Sam Rayburn Dam. The dominant factors that affected the aeration capacity during the study time were time of travel and the dissolved-oxygen deficit of the releases. Aeration was low throughout the study but increased in response to increases in the dissolved-oxygen deficit and the duration of time that the releases were exposed to the atmosphere (time of travel). The average concentration of dissolved oxygen sustained by release of 8,800 cubic feet per second decreased from 5.0 milligrams per liter at a site near the power outlet to 4.8 milligrams per liter at a site about 14 miles downstream; the time of travel averaged about 8 hours. The average concentration of dissolved oxygen in flow sustained by releases of 2,200 cubic feet per second increased from 5.2 to 5.5 milligrams per liter; the time of travel averaged about 20 hours. PROCEEDINGS OF THE WORKSHOP ON AQUATIC WEEDS: CONTROL AND ITS ENVIRONMENTAL CONSEQUENCES, ENVIRONMENTAL PROTECTION AGENCY, ENVIRONMENTAL RESEARCH LABORATORY, GULF BREEZE, FLORIDA, FEBRUARY 25-26, 1980.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-181190, Price codes: A02 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/9-81-010, Walsh, G. E., Ed., February 1981. 28 p, 1 Fig, 2 Tab, 15 Ref.

Descriptors: *Aquatic weed control, *Environmental effects, *Chemcontrol, *Biocontrol, *Mechanical control, Integrated control measures, Herbicides, Ecosystems, Insects, Fish, Pathogens, Controlled release pesticides, Costs.

Participants at the workshop reviewed the state-of-the-art of chemical, biological, mechanical, and integrated control of aquatic weeds, and discussed problems and how the EPA can assist in working toward their solutions. For each control method the method is reviewed by the group leader and followed by an outline of important points and recommendations by the participants. Chemical control is the dominant control method but information is needed in five areas: an inventory of weed problems; lack of basic data on aquatic weeds; maintenance level for aquatic weeds; effectiveness and safety of 2,4-D; and controlled-release formulations. Biological controls have shown some success. Research is needed in the areas of host specificity, cost, and potential for altering ecosystems when insects are the controlling organisms; lack of information on plant pathogens, cost of their production, and necessity of repeated treatments when plant pathogens are used; and the use of grass carp and hybrid carp when fish are the controlling organisms. The cost of harvesting and disposal of weeds after mechanical control is often prohibitive, but the method allows rapid removal of plants. Problem areas include: effects on dispersal of weeds; time of harvesting; concepts of aquatic plant control and aquatic plant management; disposal of harvested weeds; harvesting of weeds as a method of nutrient removal; and utilization of harvested weeds. Integrated control, using two or more of the above methods can achieve more precise vegetation management. Possible combinations include: herbicide treatment followed by stocking with fish, or pathogen application; mechanical harvesting followed by fish or pathogens; treatment with insects followed by pathogens; and mechanical or chemical control followed by competitive plants. 4B. Groundwater Management

EVALUATING METHODS FOR DETERMINING WATER USE IN THE HIGH PLAINS IN PARTS OF COLORADO, KANSAS, NEBRASKA, NEW MEXICO, OKLAHOMA, SOUTH DAKOTA, TEXAS, AND WYOMING; 1979,
Geological Survey, Denver, CO. Water Resources Div.
F. J. Heimes, and R. R. Luckey.
Geological Survey Water-Resources Investigations 80-111, 1980. 118 p, 9 Fig, 15 Tab, 6 Ref.

Descriptors: *Groundwater resources, *Water use, Water utilization, *Aquifer management, *Irrigation, Pumping, Discharge measurement, Instrumentation, Regional analysis, Analytical techniques, Mapping, Aerial photography, Remote sensing, Colorado, Kansas, Nebraska, New Mexico, Oklahoma, South Dakota, Texas, Wyoming, *High Plains aquifer.

The volume and areal distribution of ground-water withdrawals (pumpage) for irrigation during 1980 are required for the High Plains Regional Aquifer-System Analysis. In 1979, approaches and instrumentation that might be suitable for application to 1980 water-use determinations were tested. Pumpage was sampled by monitoring time of operation and discharge of irrigation wells during the growing season. The total volume pumped during the irrigation season was compared to the crop type and acreage irrigated. This comparison provided a means of extending sampled pumpage information to unmonitored areas using irrigated cropland maps. A transient-time flowmeter and a vibration-sensitive timing device proved to be reliable in providing discharge and time of operation information, respectively. Statistical analysis of comparisons between pumpage and irrigated cropland indicated that significant differences existed in the amounts of water applied between flood and sprinkler irrigation systems. However, statistical analyses of differences in amounts of water applied for different crop types and for selected climatic factors were inconclusive. A variety of approaches were tested to develop the irrigated cropland maps needed to extend sampled pumpage data. Of the methods tested, only Landsat data proved to be effective for application to an area as large as the High Plains. The results obtained in the 1979 evaluation of instrumentation and pumpage sampling approaches have been used to formulate a strategy for monitoring irrigation water use in the High Plains in 1980. EFFECTS OF ARTIFICIAL-RECHARGE EXPERIMENTS AT SHIP CREEK ALLUVIAL FAN ON WATER LEVELS AT SPRING ACRES SUBDIVISION, ANCHORAGE, ALASKA,
Geological Survey, Tacoma, WA. Water Resources Div.
W. Meyer, and L. Patrick.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $5.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1284, 1980. 42 p, 22 Fig, 2 Tab, 4 Ref.

Descriptors: *Artificial recharge, *Water levels, *Groundwater, *Model studies, *Land use, Aquifer characteristics, Groundwater movement, Observation wells, Water level fluctuations, Forecasting, Hydrogeology, Hydrographs, Alaska, *Anchorage.

The effect of the artificial recharge experiments on water levels at Spring Acres subdivision, Anchorage, Alaska, was evaluated using two digital models constructed to simulate groundwater movement and water-level rises induced by the artificial recharge. The models predicted that the artificial recharge would have caused water levels in the aquifer immediately underlying Spring Acres subdivision to rise 0.2 foot from May 20 to August 7, 1975. The models also predicted a total rise in groundwater levels of 1.1 feet at this location from July 16, 1973 to August 7, 1975, as a result of the artificial-recharge experiments. Water-level data collected from auger holes in March 1975 by a consulting firm for the contractor indicated a depth to water of 6-7 feet below land surface at Spring Acres subdivision at this time. Water levels measured in and near Spring Acres subdivision several years before and after the 1973-75 artificial-recharge experiments showed seasonal rises of 2 to 12.4 feet. A depth to water below land surface of 2.6 feet was measured 600 feet from the subdivision in 1971 and in the subdivision in 1977. Average measured depth to water in the area was 7.0 feet from early 1976 to September 1979. (USGS)

ASSESSMENT OF PUBLIC GROUNDWATER SUPPLIES IN ILLINOIS,

Illinois State Water Survey, Urbana.
A. P. Visocky, H. A. Wehrmann, and K. W. Kim.
Circular 144, 1980. 74 p, 2 Fig, 1 Tab, 2 Ref, Append.

Descriptors: *Illinois, *Aquifer characteristics, *Groundwater management, Groundwater depletion, *Aquifer testing, Aquifer management, Aquifers, Well yield, Observation wells, Groundwater reservoirs, Groundwater storage, Bedrock, Glacial drift, *Groundwater availability.

This report summarizes available information regarding the current status of public groundwater supplies in Illinois, excluding the six northeastern counties. Data on each public groundwater supply were reviewed, and supplies were assessed as adequate, marginal, or deficient, in terms of present demands. The study indicated that thirty-nine supplies were marginal for current use and four were deficient. The majority of the marginal and deficient supplies are located in the central third of the state, where most of the other supplies are also located. The 677 public groundwater supplies outside northeastern Illinois have an estimated daily pumpage of 233 million gallons. Among the individual counties, Winnebago County had the highest daily pumpage, with 43.1 mgd. The largest individual supply is the city of Rockford, which pumps an average of 37 mgd. The largest supplies were generally obtained from major alluvial or bedrock valley deposits. Thirty counties were found to have one or more supplies that are less than adequate. This report is part of a three-part plan to study and test water resources and determine alternatives where necessary. (Garrison-Omniplan)

ADEQUACY AND ECONOMICS OF WATER SUPPLY IN NORTHEASTERN ILLINOIS: PROPOSED GROUNDWATER AND REGIONAL SURFACE WATER SYSTEMS, 1985-2010,
Illinois State Water Survey, Urbana.
K. P. Singh, and J. R. Adams.
Report, May 1980. 200 p, 47 Fig, 68 Tab, 39 Ref, Append.

Descriptors: *Illinois, *Groundwater resources, Well yield, *Economic aspects, *Groundwater availability, Costs, Municipal water, Economic yield, Well data, Cost analysis, *Water supply development, Cost-benefit ratio, River systems, Aquifer management, Radium radioisotopes, Groundwater management.

The purpose of this three-year cooperative effort between the State Water Survey and the Division of Water Resources was to plan for the optimal use of water resources in northeastern Illinois and to ensure that all towns in Cook, Du Page, Kane, Lake, McHenry, and Will Counties will have an adequate and dependable water supply up to the year 2010. This area has a population of about seven million and a land area of 3,714 square miles; municipal and industrial water supplies are presently obtained either from Lake Michigan or from groundwater. Future water demands were projected using the appropriate equation with a multiplier to account for each town's variation from the average regression equation. Cost functions, in terms of July 1980 dollars, were developed for wells, well pumps, reservoirs, water treatment, pipelines, and pipeline pumping stations. The optimal systems and their projected demands for 2010 were found to be: Lake County system supplying 17 towns, 27.80 mgd; Southern Cook County system supplying 8 towns, 19.98 mgd; Du Page County system supplying 19 towns, 77.55 mgd; Northwestern Cook County, 14 towns, 61.59 mgd; Fox River system, 8 towns, 35.61 mgd; and Kankakee River system, 10 towns, 25.33. Except for the Fox River system, conjunctive use is not economical. (Garrison-Omniplan)

4D. Watershed Protection

CONSERVATION TILLAGE: BEST MANAGEMENT PRACTICE FOR NONPOINT RUNOFF,
Wisconsin Univ.-Madison. Dept. of Soil Science.
D. H. Mueller, T. C. Daniel, and R. C. Wendt.
Environmental Management, Vol 5, No 1, p 33-53, January, 1981. 8 Fig, 8 Tab, 70 Ref.

Descriptors: *Soil conservation, *Erosion control, *Cultivation, Soil management, Contour farming, Erosion, Furrows, Soil erosion, Water pollution sources, Conservation tillage.

Conservation tillage, alone or in combination with other conservation practices, is an effective method for solving serious water erosion problems. It may also be useful in controlling wind erosion in dry areas. Conservation tillage is any tillage system that reduces the loss of soil and/or water when compared to unridged or clean tillage. Disking and no-till planting are two such systems. Conservation tillage practices can produce yields equal to or better than conventional techniques, and less phosphorus is lost from the land. No-till and contoured chisel plowing can reduce soil loss by approximately 90%, while other methods may reduce soil loss by 50%. Total phosphorus losses are reduced, but there have been no studies on the effects of this on aquatic life. There may be lower sediment phosphorus loss but higher available phosphorus loss. It is also unclear if pesticide losses are reduced. (Small-FRC)

5A. Identification Of Pollutants

SURVEY AND CONTROL OF SYNTHETIC ORGANICS IN TEXAS WATER SUPPLIES,
Texas A and M Univ., College Station. Water Resources Inst.
B. Batchelor, J. D. Shannon, and P-d. Yang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198384, Price codes: A08 in paper copy, A01 in microfiche. Technical Report 109, January, 1981. 155 p, 41 Fig, 5 Tab, 136 Ref, 3 Append. OWRT-A-047-TEX(1), 14-34-0001-9046, 14-34-0001-0146.

Descriptors: *Texas, *Water quality control, *Chlorinated hydrocarbons, Chlorination, *Water treatment, Coagulation, Turbidity, Synthesis, Lakes, Rivers, Chlorine, Halogens, Residual chlorine, Waste water treatment, Organic compounds, Water analysis, Trace levels, Toxins, Chemical treatment, Waste water oxidation, Oxidation process.

The primary objective was to evaluate the significance of synthetic compounds produced during treatment in selected water supplies and to study the effectiveness of conventional/nonconventional treatment technology for their control. Four Texas water supplies (Lakes Somerville and Livingston, and the Neches and Sabine Rivers) were surveyed to determine their tendency to form trihalomethanes (THM) when chlorinated. Conventional alum coagulation (CAC) was studied in a series of jar tests; effect of pH and alum dose was determined for removal of THM formation potential (THMFP), uv-absorbance, total organic carbon, and visible-absorbance. The latter was used as a surrogate for turbidity. Modification of CAC (addition of acid or base, or of secondary coagulants) was studied; a medium molecular weight cationic polymer and activated silica were used with alum and as sole coagulants. An innovative treatment process for removal of THMFP was also investigated. Batch and continuous flow systems using activated alumina adsorption significantly removed organics, uv-absorbance and THMFP from drinking water. (Zielinski-IPA)

DEVELOPMENT OF METHODS FOR THE DETECTION OF TRACE AMOUNTS OF SELECTED CARCINOGENIC AND MUTAGENIC AMINES IN WATER,
Illinois Univ. at Urbana-Champaign. Inst. for Environmental Studies.
J. C. Means, E. G. Perkins, D. Ellis, and M. M. Chaudry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198350, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, February, 1981. Illinois Water Resources Center, University of Illinois Research Report 156. 51 p, 16 Fig, 12 Tab, 49 Ref. OWRT-B-107-ILL(1), 14-34-0001-8081.

Descriptors: Technology, *Detection limits, *Trace levels, *Nitrogen compounds, *Water pollution, *Carcinogens, Chromatography, Technology transfer, Organic compounds, Organic loading, Gas chromatography, Gas liquid chromatography, Separation, Techniques, Sampling, Sample preparation, Water sampling, Water quality measurement, Stream pollution, Hazardous materials, Toxins.

Efforts were focused on the development of analytical schemes for reliable detection, separation, and quantification of trace levels of a number of aromatic and heterocyclic amines using both liquid (HPLC) and gas (GLC) chromatography. Field evaluations of the final methods were carried out and reported. It was found that GLC with flame-ionization and nitrogen-specific detection can successfully be used for analysis of amine mixtures of wide volatility using fairly non-polar columns (e.g., OV-17; Tenax GC). Some high-volatility amines appear lost during extraction/concentration; thus, XAD resin columns may be superior for amine concentration and also eliminate tedious extraction steps that affect amine recoveries. Use of river water as a matrix showed that some amines bind to biological and/or inorganic particulate matter present; procedures are needed to account for such bound residues. HPLC (UV/fluorescence detection) successfully analyzed the amine mixtures also, using acetonitrile gradients in water and reverse-phase C-18 columns. HPLC may offer some advantages in analyzing thermally-labile amines or polar metabolities of amines. (Zielinski-IPA)
W81-02721

GC/MS METHODOLOGY FOR MEASURING PRIORITY ORGANICS IN MUNICIPAL WASTE WATER TREATMENT,
Cincinnati, OH. Municipal Environmental Research Lab.
D. F. Bishop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127813, Price codes: A02 in paper copy, A01 in microfiche. Project Summary EPA-600/S2-80-196, December, 1980. 5 p, 2 Fig, 1 Tab, 9 Ref.

Descriptors: *Mass spectrometry, *Gas chromatography, *Organic compounds, *Municipal waste water, Sludge, Pollutants, *Waste water analysis, Pollutant identification, Waste water treatment.

An EPA-developed methodology for measuring priority toxic organics in municipal waste waters and sludges is based on gas chromatography/mass spectrometry (GC/MS) technology. The methodology separates the purgeable priority organics from the sample by purging with inert gas and trapping the organics on a Tenax and silica gel trap. The organics are then desorbed, identified, and quantitated with packed column GC/MS analysis. The extractable organics are separated by extracting with methylene chloride, first at pH 11 and then at pH 2. The organics in the two extracts are identified and quantitated by packed column GC/MS analysis. The basic methodology analyzes the purgeable organics in municipal wastewaters satisfactorily but requires one modification in the equipment. By substituting charcoal for the silica gel in the trap, all of the purgeable priority organics are identified and satisfactorily quantified. In the basic methodology for extractable organics, a few of the organics are not measured well. Extracts may require clean-up or organic separation before GC/MS analysis. Principal classes of organic interferences include lipids, fatty acids, and saturated hydrocarbons. The approaches to separate the desirable priority organics from the interferences include acid-base separation, molecular size separation, and polarity separation. (Moore-SRC)

DETERMINATION OF LEAD IN DRINKING WATER BY ATOMIC ABSORPTION SPECTROPHOTOMETRY WITH ELECTROTHERMAL ATOMISATION,
Severn-Trent Water Authority, Nottingham (England). Regional Lab.
M. P. Bertenshaw, D. Gelsthorpe, and K. C. Wheatstone.
Analyst, Vol 106, No 1258, p 23-31, January, 1981. 1 Fig, 8 Tab, 15 Ref.

Descriptors: *Lead, Water analysis, Lanthanum, Spectrometry, Analytical techniques, *Pollutant identification, *Drinking water, *Atomic absorption spectrophotometry.

Determination of lead in water by electrothermal atomization was improved by pretreatment with lanthanum, either by addition of lanthanum chloride to the sample or preferably, by impregnation of the furnace tube. Samples pretreated with lanthanum chloride were given 0.1% mass/volume for manual injection and 0.01% mass/volume for automated injection. Impregnation of furnace tubes was done by immersing the tubes in a concentrated solution of lanthanum nitrate and leaving in a vacuum desiccator until the solution had been absorbed. Limit of detection was less than 1.0 microgram per liter, total standard deviation less than 1.5 micrograms per liter or 5% of the concentration, and bias less than 5 micrograms per liter or 10% of the concentration over a range of 0-100 micrograms per liter. (Cassar-FRC)

SCANNING ELECTRON MICROSCOPE EVIDENCE FOR BACTERIAL COLONIZATION OF A DRINKING-WATER DISTRIBUTION SYSTEM,
California Univ., Irvine. Div. of Environmental Analysis.
H. F. Ridgway, and B. H. Olson.
Applied and Environmental Microbiology, Vol 41, No 1, p 274-287, January, 1981. 14 Fig, 26 Ref.

Descriptors: *Iron bacteria, *Bacteria, *Distribution systems, Pipes, Water supply systems, Microorganisms, Corrosion, *Pollutant identification, Gallionella, Potable water.

The nature and characteristics of microorganisms on the surfaces of a water distribution main in service for 25 years and in particulate matter in fire hydrant water and well water were examined by scanning electron microscope. The bacteria-like structures and microcolonies, sparsely and randomly distributed along the pipe surfaces, included chain-forming cocci, filamentous types (most frequently observed), prosthecate types (usually found in oligotrophic environments), and Gallionella, an iron-oxidizing bacterium with typical spiral stalks. The surfaces of suspended particles contained large numbers of rod-shaped bacteria. Major elements detected by X-ray energy scans of the pipe surface were Si, P, S, Ca, and Fe. Minor amounts of Zn, Mg, Al, K, and Mn were slso seen. These microorganisms could be responsible for taste, odor, or color problems in water systems. In addition, the bacteria count may be underestimated. Extensive aggregation of cells and the building of slime layers may reduce the effectiveness of disinfection methods and encourage further pipe fouling and corrosion. (Cassar-FRC)

Applied and Environmental Microbiology, Vol 41, No 1, p 199-202, January, 1981. 1 Fig, 2 Tab, 22 Ref.

Descriptors: *Plasmids, *Bacteria, *Marine bacteria, *Oil pollution, Aquatic bacteria, Water pollution effects, Bioindicators, Vibrio, Microbiology, *Gulf of Mexico.

Vibrio spp. were collected from an operating oil field 50 km south-southeast of Galveston, Texas, in the Gulf of Mexico and examined for the presence of plasmids, extrachromosomal deoxyribonucleic acid elements. The oil field Vibrio spp. samples had 35% plasmid-containing samples with an average of 2.5 (range 2-7) plasmids each; the control site, 23%, with an average of 1.5 plasmids each. Over half the plasmids were in the size range 0-12 Megadaltons, a substantial number were in the 10-80 Mdal range, very few greater than 80, and none over 100. Low level chronic pollution from hydrocarbons and sulfur is believed to be the cause of these changes. (Cassar-FRC)

THE STATISTICAL DISTRIBUTION OF SEWAGE AND SLUDGE ANALYSES,
Oxford Univ. (England), Dept. of Agricultural Science.
P. H. T. Beckett.
Environmental Pollution (Series B), Vol 1, No 1, p 27-35, January, 1980. 5 Fig, 1 Tab, 6 Ref.

Descriptors: *Sewage sludge, *Sludge disposal, *Statistical methods, Sampling, Analysis, Heavy metals, Metals, Copper, Nickel, Zinc, Cadmium, Lead, Chromium, Pollutant identification, Path of pollutants, Sewage, Agriculture, Soil amendments, Disposal, *Great Britain.

Heavy metals were determined in successive samples of raw sewage and digested sewage sludge from a medium-sized sewage works in Great Britain over the period August-December 1973. Cu, Ni, Zn, Cd, Pb, and Cr concentrations in finished sludge were log normally distributed about their central value. However, raw sewage analyses showed marked skewness to high values, with Cu, Zn, and Cd also showing minor low peaks. This variability may have been caused by dilution at the source or reduction in industrial production during holidays and weekends. Cu levels were highest on Tuesday through Thursday; Zn, Cd, Pb, and Cr, highest on Thursday; and Ni, highest on Thursday through Sunday. All metal levels were reduced by half or more during Christmas week. Rainfall had very little effect on metal concentrations. An understanding of these distributions is essential when sludge is applied on agricultural land. (Cassar-FRC)

AN ION-EXCHANGE TECHNIQUE FOR CONCENTRATING AMMONIA FROM SMALL VOLUMES OF SEAWATER,
Oregon State Univ., Corvallis. Dept. of General Science.
R. T. Riley, and M. C. Mix.
Marine Chemistry, Vol 10, No 2, p 159-164, 1981. 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Ammonia, *Analytical techniques, Nitrogen, *Ion exchange, *Seawater, Water quality control.

A very sensitive method is described for the determination of ammonia in seawater. The method is suitable where the size of the seawater sample is limited due to experimental design. The method involves an ion-exchange concentration technique using the phenol-hypochlorite reaction for assaying the ammonia concentration in the ion-exchange column eluate. It has been used for seawater samples of 5 and 10 ml and can be scaled down for use with 1.0 ml samples. The method is based in part on the batch ion-exchange procedure for plasma ammonia as previously described. As an example of the method a 10 ml seawater sample was analyzed with ammonia concentrations established at 10 to 150 microgram/1. (Baker-FRC)

ISOLATION OF DISSOLVED ORGANIC MATTER AND COPPER-ORGANIC COMPLEXES FROM ESTUARINE WATERS USING REVERSE-PHASE LIQUID CHROMATOGRAPHY,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
G. L. Mills, and J. G. Quinn.
Marine Chemistry, Vol 10, No 2, p 93-102, 1981. 1 Fig, 2 Tab, 21 Ref.

Descriptors: Sea water, *Chromatography, *Organic matter, *Copper, *Estuaries, *Narragansett Bay, Rhode Island, Analytical techniques.

Preliminary results on the use of reverse-phase liquid chromatography (RPLC) in the study of marine dissolved organic matter (DOM), with particular emphasis on copper-organic complexes in estuarine waters, are reported. Seawater samples were collected from various salinity mixing regimes ranging from the Providence River in the upper Narragansett Bay, Rhode Island to the lower bay. The procedure succeeded in isolating 10-30% of the organic matter and up to 50% of the total dissolved copper from various bay samples. Chromatograms were obtained using high performance liquid chromatography of the isolated organic matter. Qualitative differences were noted in the organic matter content between sampling stations. CHROMATOGRAPHIC ENRICHMENT OF ACIDIC COMPOUNDS FROM ORGANIC SOLVENTS USING ALKALI METAL SILICATES,
Columbia National Fisheries Research Lab., MO.
D. L. Stalling, J. D. Petty, and L. M. Smith.
Journal of Chromatographic Science, Vol 19, No 1, p 18-26, January, 1981. 7 Fig, 2 Tab, 25 Ref.

Descriptors: *Chromatography, *Acids, *Phenols, Silicates, Alkali metals, Pollutant identification, Analytical techniques, Adsorption, Silica, Cesium, Potassium, Sodium, Lithium, Organic compounds, Pesticide residues, Herbicides.

Alkali metal (Li, Na, K, and Cs) hydroxide-treated silica gels were evaluated for their ability to retain, separate, and enrich trace residues of acidic components, especially substituted phenols. The method is applicable to determination of residues (including 2,4-D, picloram, and sulfa drugs) in tissues, soil, and water. Retention of acid compounds increased with increasing ionic radius of the alkali metal. Cs silicate was clearly superior for retention of sterically-hindered phenols such as 2,4,6-trimethylphenol, but BHT, 2,6-ditertiarybutyl-4-methyl phenol, did not react with any silica gel tried. Samples were applied to columns 1.0 x 8.5 cm in methylene chloride/cyclohexane 1:1 by volume and eluted with this solvent or 0 to 50% methanol mixed with this solvent. (Cassar-FRC)

INCIDENCE OF MARINE BDELLOVIBRIOS LYTIC AGAINST VIBRIO PARAHAEMOLYTICUS IN CHESAPEAKE BAY,
Maryland Univ., Baltimore. Dept. of Microbiology.
H. N. Williams, W. A. Falkler, Jr., and D. E. Shay.
Applied and Enviromental Microbiology, Vol 40, No 5, p 970-972, November, 1980. 2 Tab, 8 Ref.

Descriptors: *Estuaries, *Marine bacteria, *Bacterial analysis, Water sampling, Water properties, Water quality data, *Chesapeake Bay.

A study of the distribution of bdellovibrios lytic against Vibrio parahaemolyticus was undertaken in the Chesapeake Bay by collecting water samples at nine sites. The environmental parameters of each sample were determined. Examination of randomly selected plaques by phase and electron microscopy demonstrated the presence of curved, rod-shaped bacteria measuring approximately 0.3 microns in width and 10 microns in length. The characteristics and morphological properties observed indicated that the organisms were probably bdellovibrio plaque-forming units. There were no apparent relationships between the number of bdellovibrios iso-

lated from the sampling stations and the measured environmental parameters or the total number of bacteria recovered. Bdellovibrios were isolated from 8 of the sampling stations. Higher numbers than previously reported with sea or ocean water were recovered in the midregion of the bay. (Small-FRC)

ENUMERATION AND CHARACTERIZATION OF STANDARD PLATE COUNT BACTERIA IN CHLORINATED AND RAW WATER SUPPLIES,
Oregon State Univ., Corvallis. Dept. of Microbiology.
M. W. LeChevallier, R. J. Seidler, and T. M. Evans.
Applied and Environmental Microbiology, Vol 40, No 5, p 922-930, November, 1980. 2 Fig, 4 Tab, 27 Ref.

Descriptors: *Bacterial analysis, *Separation techniques, *Drinking water, *Raw water, Water quality data, Chlorination, Water supply, Actinomyces, Aerobacter, Enterobacter.

A simple scheme to rapidly identify standard plate count (SPC) bacteria is proposed, and the incidence and distribution of these organisms in chlorinated drinking water and raw surface water supplies of an Oregon coastal community were determined. Samples were collected from the drinking water supply of a community of 14,000 residents and from two streams supplying raw water to the city. Nearly 700 SPC bacteria were isolated from the two types of water and identified as to genus, species, or group. In the chlorinated water, Actinomycetes and Aeromonas species were the two most common groups. In the raw water, Aeromonas spp. and Enterobacter agglomerans were the two most common groups. Identification of bacterial populations before and after contact with chlorine at doses of 1 to 2 mg/liter for 1 hr revealed that chlorination selects for gram-positive bacteria. The membrane filter technique for enumerating SPC bacteria was found to recover significantly higher numbers than the standard pour plate technique. Thus, this is a useful method for determining water quality deterioration within a distribution system. (Small-FRC)

DETECTION OF LIPID DEGRADATION PRODUCTS IN THE WATER OF A RESERVOIR DURING A BLOOM OF SYNURA UVELLA,
Tuebingen Univ. (Germany, F.R.). Inst. fuer Chemische Pflanzenphysiologie.
F. Juttner.
Applied and Environmental Microbiology, Vol 41, No 1, p 100-106, January, 1981. 4 Fig, 4 Tab, 28 Ref.

Descriptors: *Organic compounds, *Algae, *Lipids, *Odor, Synura uvella, Eutrophication, Biodegradation, Aquatic algae, Pollutant identification, Analytical techniques, Water analysis, *Reservoirs, Odor-producing algae.

The offensive cod liver oil-like odor present in a reservoir during a Synura uvella bloom was attributed to trans,cis-deca-2,4-dienal and trans,cis-hepta-2,4-dienal. These substances and 53 more organic compounds were identified by stripping the volatile compounds from the raw water and detecting by gas-liquid chromatography. Air pollution was considered the source of some aromatic compounds and halogenated compounds. The alkenes (8 carbon), aldehydes (5-10 carbon), alcohols (5-8 carbon), ketones (5-11 carbon), and nor-carotenoids were regarded as algal excretion products. Although the cod liver odor masked all other odors, there were other odor-producing compounds present: beta-ionone (violets), beta-cyclocitral (tobacco), and oct-1-en-3-ol and 2-pentyl furan (both decaying fungi). (Cassar-FRC)

UTILIZATION OF LOW CONCENTRATIONS OF STARCH BY A FLAVOBACTERIUM SPECIES ISOLATED FROM TAP WATER,
Keuringsinstituut voor Waterleidingartikelen, Rijswijk (Netherlands).
D. van der Kooij, and W. A. M. Hijnen.
Applied and Environmental Microbiology, Vol 41, No 1, p 216-221, January, 1981. 5 Fig, 4 Tab, 29 Ref.

Descriptors: *Organic compounds, *Bacteria, *Starch, Carbohydrates, Flavobacteria, *Potable water, Pollutant identification, Water analysis, Analytical techniques, Microorganisms, Netherlands.

A yellow-pigmented bacterium of the Flavobacterium species was identified in tap water from the municipal Dune Waterworks, The Hague, The Netherlands. Here, dune-infiltrated river water is treated with powdered activated carbon, rapid sand filtration, and slow sand filtration. Dissolved organic carbon levels in the finished water were 2-3 mg C per liter. Although the bacteria were able to multiply in the plain tap water, addition of small amounts of starch and glucose (as low as 1 microgram carbon per liter) enhanced growth. Substrate affinities of the Flavobacterium were 3.9 micrograms of starch C and 3.3 micrograms of glucose C per liter. (Cassar-FRC)

RECOVERY OF COLIPHAGES FROM WASTE WATER EFFLUENTS AND POLLUTED LAKE WATER BY THE MAGNETITE-ORGANIC FLOCCULATION METHOD,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
G. Bitton, L. T. Chang, S. R. Farrah, and K. Clifford.
Applied and Environmental Microbiology, Vol 41, No 1, p 93-96, January, 1981. 4 Tab, 16 Ref.

Descriptors: *Flocculation, *Coliphages, *Water analysis, Microorganisms, *Bacteriophage, Effluents, Pollutant identification, Analytical techniques, Waste water.

A flocculation method using magnetite and isoelectric casein was used to recover coliphages from waste water effluent and sewage-contaminated lake water. It is rapid (30 min flocculation time), inexpensive, efficient, and suitable for field use. The method does not require centrifugation or filtration, only a large beaker and a U-shaped permanent magnet. Using the technique, 68, 90, and 100% of coliphages were recovered from activated sludge, trickling filter and primary effluents, respectively, working more effectively with the more concentrated effluents. Recovery of coliphages from a lake showed 230 to 1900 plaque forming units per liter. (Cassar-FRC)

SIMPLE METHOD FOR CONCENTRATION OF BACTERIA FROM LARGE VOLUMES OF TAP WATER,
Baylor Coll. of Medicine, Houston, TX. Dept. of Virology and Epidemiology.
S. M. Goyal, and C. P. Gerba.
Applied and Environmental Microbiology, Vol 40, No 5, p 912-916, November, 1980. 5 Tab, 15 Ref.

Descriptors: *Filters, *Bacteria, *Separation techniques, *Drinking water, Escherichia coli, Salmonella, Microorganisms.

The use of positively charged depth filters for the concentration and detection of bacteria in large volumes of tap water was investigated. Dechlorinated tap water was passed under positive pressure through positively charged filter media. At ambient pH levels, more than 90% of seeded bacteria adsorbed to the filters. Adsorbed bacteria were eluted by passing a small volume of Trypticase soy broth opposite to the inflow. Using this technique, E. coli and Salmonella serovar B organisms in 20 liters of tap water were concentrated in a final volume of 50 ml. The average recovery efficiency was 30% or greater. The filters used consisted of a cellulose diatomaceous earth-charge-modified resin such as series S, Zeta-plus, (AMF CUNO, Meriden, Conn.) and eliminated the need for extensive acidification of the initial sample. The method could be useful when the concentration of bacteria is extremely low or could be used in conjunction with other methods for the rapid determination of microorganisms in water. (Small-FRC)

ORGANOCHLORINE COMPOUNDS IN MUSSELS FROM SCOTTISH COASTAL WATERS,
Freshwater Fisheries Lab., Pitlochry (Scotland).
A. A. Cowan.
Environmental Pollution (Series B), Vol 2, No 2, p 129-143, 1981. 4 Fig, 10 Tab, 24 Ref.

Descriptors: *Mussels, *Bioindicators, *Pesticide residues, Dieldrin, DDT, Water quality, Organic pesticides, Sea water, Chlorides, Water quality, *Scotland, *Coastal waters.

Mytilus edulis was used as a bioindicator to study the extent of pollution of Scottish coastal waters by pesticides and PCBs. Homogenates of total shell contents were made of between 29 and 50 animals, and organochlorine residue analysis was carried out. Concentrations of dieldrin, PCB, hexachlorocyclohexane, hexachlorobenzene, and total DDT were determined. The concentrations found ranged from one to three orders of magnitude. Mussels were found to be useful organisms for identifying areas significantly contaminated by organochlorines. The influence of the size, sexual maturity, and flushing procedure on the pesticide content in the mussel has not been fully determined, but changes are thought to be smaller than those found between polluted and clean areas. In this study, four sites were polluted by all three components, seven by two, and ten sites by one pollutant. (Small-FRC)

DETERMINATION OF MAGANESE IN NAIAD MOLLUSC SHELLS BY NEUTRON ACTIVATION ANALYSIS,
Ohio State Univ., Columbus.
R. T. Pruiskma, T. R. Sweet, D. H. Stansbery, and B. K. Hajek.
Environmental Pollution (Series B), Vol 2, No 1, p 49-57, January, 1981. 5 Fig, 1 Tab, 7 Ref.

Descriptors: *Bioindicators, *Mollusks, *Naiads, *Manganese, Rivers, Shellfish, Aquatic animals, Pollutant identification, Analytical techniques, Absorption, Water pollution effects, Path of pollutants, Muskingum River, *Ohio.

Shells from naiads in the Muskingum River, Ohio, were analyzed for manganese content by neutron activation analysis to determine their possible use as bioindicators of water pollution. Two species were obtained at Beverly, O., and 5 species 11 miles downstream at Lowell, O. The shells were part of a university museum collection. Mn concentrations at Beverly were as follows (in ppm): Obliquaria reflexa, 529 (1965), 1008 (1966), 646 (1967); Quadrula pustulosa, 509 (1965), 694 (1966), 591 (1967), and 408 (1968). At Lowell concentrations were Quadrula quadrula, 412-304 (1967-68); Amblema plicata, 366 (1967), 479 (1968); Obovaria subrotunda, 396 (1967), 354 (1968); Obliquaria reflexa, 862 (1965), 750 (1966); and Quadrula pustulosa, 276 (1965), 320 (1966), 328 (1967), and 403 (2068). Differences in manganese concentrations depending on species and year were observed in some cases. A significant (2% level) difference was found in Q. pustulosa manganese levels at the two locations studied, possibly due to differences in manganese content of the water as a result of coal mine drainage. PAL SEWAGE SLUDGE APPLIED TO AGRICULTURAL SOILS,
Wright State Univ., Dayton, OH. Dept. of Biological Sciences.
W. S. Brewer, A. C. Draper, III, and S. S. Wey.
Environmental Pollution (Series B), Vol 1, No 1, p 37-43, January, 1980. 1 Fig, 1 Tab, 21 Ref.

Descriptors: *Sludge disposal, *Organic compounds, *Nitrogen compounds, Nitrosamines, Agriculture, Soil amendments, Sewage sludge, Water pollution sources, *Pollutant identification, Path of pollutants, DMN, DEN.

Sludges applied to agricultural soils contained a mean dimethyl nitrosamine content of 0.272 micrograms per gram (wet basis). Between 59.8-1365 micrograms nitrosamine may be incorporated into 1 cubic meter of soil at a mean application rate of 1.95 kg per sq meter per year. Nitrosamines, known to be carcinogenic, mutagenic, and teratogenic, and believed persistent in soils, could accumulate in groundwater, surface water, and plant material if applied as a soil amendment to agricultural land. Three analytical methods were used to analyze 16 samples of municipal waste water sludge--gas-liquid chromatography, thin-layer chromatography, and colorimetry. The colorimetric method detected nitrosamines in 11 samples. Using both chromatographic methods, either dimethyl nitrosamine, diethyl nitrosamine, or both were detected in a total of 8 samples. (Cassar-FRC)

ISOLATION AND IDENTIFICATION OF AN AMES-MUTAGENIC COMPOUND PRESENT IN KRAFT CHLORINATION EFFLUENTS,
Pulp and Paper Research Inst. of Canada, Pointe Claire (Quebec).
B. R. Holmbom, R. H. Voss, R. D. Mortimer, and A. Wong.
Tappi, Vol 64, No 3, p 172-174, March, 1981. 2 Fig, 8 Ref.

Descriptors: *Pulp wastes, *Chlorination, *Effluents, Organic compounds, Mutagenesis, Pollutant identification, Bacteria, Industrial wastes, Wastes.

An Ames-mutagenic compound in kraft chlorination effluents was tentatively identified as 3-chloro-4-dichloromethyl-5-hydroxy-2(5H)-furanone on the basis of high resolution mass spectroscopy and ultraviolet and infrared spectroscopic data. Concentration of this compound is 5-10 micrograms per liter in the original effluent. It has an Ames mutagenicity of 10,000 revertant counts per nanomole using TA100 with no S-9 addition as a test strain. The original effluent had an Ames mutagenicity of 2,000-3,000 revertants per ml effluent. (Cassar-FRC)

YEASTS FROM MARINE AND ESTUARINE WATERS WITH DIFFERENT LEVELS OF POLLUTION IN THE STATE OF RIO DE JANEIRO, BRAZIL,
Universidade Federal do Rio de Janeiro (Brazil). Dept. de Microbiologia Geral.
A. N. Hagler, and L. C. Mendonca-Hagler.
Applied and Environmental Microbiology, Vol 41, No 1, p 173-178, January, 1981. 1 Fig, 3 Tab, 29 Ref.

Descriptors: *Yeasts, *Coliforms, *Rio de Janeiro, Brazil, Microorganisms, *Estuaries, *Pollutant identification, Water pollution, Bacteria, Sewage bacteria, Bioindicators.

Yeasts were determined in water samples from 24 sites in the area of Rio de Janeiro, Brazil. Pollution levels and mean total coliform counts were as follows: heavy, 340,000 CFU per 100 ml; moderate, 9,600; light, 230; and nil, 73. Mean salinities varied from 14.2 to 27.4% in the estuarine sites. Mean total yeast counts for these 4 classifications of water were 2800, 200, 9.9, and 0.58 CFU per 100 ml. The most prevalent were Candida, Rhodotorula, Torulopsis, Hanseniaspora, Debaryomyces, and Trichosporon. Twenty-one species represented 86% of the total yeast counts. Although pink yeasts have been suggested as bioindicators for pollution, this study shows that they do not represent a consistent proportion of the yeast population and are not correlated with other specific pollution factors. (Cassar-FRC)

COMPARISON OF THE DIFFERENT METHODS FOR THE RECOVERY OF SUSPENDED MATTER FROM ESTUARINE WATERS: DEPOSITION, FILTRATION AND CENTRIFUGATION: CONSEQUENCES FOR THE DETERMINATION OF SOME HEAVY METALS,
Institut de Geologie du Bassin D'Aquitaine, Talence (France).
H. Etcheber, and J. M. Jouanneau.
Estuarine and Coastal Marine Science, Vol 11, No 6, p 701-707, December, 1980. 4 Tab, 12 Ref.

Descriptors: *Estuaries, *Heavy metals, *Separation techniques, Deposition, Filtration, Centrifugation, *Suspended solids, Metals, Analytical techniques, Water analysis, Gironde estuary, *France, Pollutant identification, Zinc, Copper, Manganese, Iron, Nickel, Lead, Turbidity.

Methods for recovery of suspended matter to determine heavy metal concentrations were compared in samples obtained from the Gironde estuary. Filtration produced the best recovery. Deposition was most useful in cases of flocculation and high turbidity. Centrifugation was satisfactory in zones of low turbidity. On low turbidity waters differences in the three methods were not significant for Fe, Mn, and Zn. However, deposition lost 20% of the Cu, 14% of the Pb, and 10% of the Ni when compared with filtration. Centrifugation caused increases in Ni (40%), Pb (12%), and Cu (uneven), possibly from equipment contamination. Analyses of high turbidity waters produced similar results with all 3 methods, but slight contamination of the Ni determinations occurred with centrifugation. (Cassar-FRC)

SIMULTANEOUS MEASUREMENTS OF TRANSPARENCY AND IRRADIANCE IN THE COASTAL WATERS OF NORTH WALES,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
B. J. Topliss, J. R. Hunter, and J. H. Simpson.
Marine Environmental Research, Vol 4, No 1, p 65-79, 1980-81. 4 Fig, 2 Tab, 19 Ref.

Descriptors: *Suspended solids, *Sea water, *Optical properties, Turbidity, Light penetration, Attenuation, Physical properties, Water properties, Pollutant identification, Coastal waters, *Wales, Great Britain.

Natural optical conditions of marine waters must be known before comparisons are made with measurements in polluted waters. Therefore, simultaneous measurements of the diffuse attenuation coefficient and the collimated beam attenuation coefficient were made continuously over a year off the coast of North Wales. The ratio of the collimated beam coefficient to the diffuse attenuation coefficient varied throughout the year between 11:1 and 5:1. Both parameters must be measured together to acquire an understanding of the nature of suspended material in the waters. (Cassar-FRC)

HEAVY METALS IN DONAX TRUNCULUS L. (BIVALVIA) IN HAIFA BAY, MEDITERRANEAN (ISRAEL),
Israel Oceanographic and Limnological Research Ltd., Haifa.
H. Hornung, and O. H. Oren.
Marine Environmental Research, Vol 4, No 3, p 195-201, 1980-81. 2 Fig, 3 Tab, 23 Ref.

Descriptors: *Bioindicators, *Mollusks, *Heavy metals, Baseline studies, *Pollutant identification, Analytical techniques, Metals, *Israel, Mediterranean Sea, Haifa Bay, Mercury, Copper, Zinc, Cadmium, Lead, Aquatic animals, Shellfish.

Since the common bioindicator Mytilus is absent from the Israeli Mediterranean shore, Donax (Serrula) trunculus, a mollusk common to this area, was chosen for a baseline study of heavy metal pollution. Mussels were collected in Haifa Bay during November 1975 - September 1978. Concentrations of metals in soft parts of the mussels, expressed in micrograms per gram (dry weight) were as follows: Hg, 0.04-0.91; Cu, 6.13-35.37; Zn, 51.2-141.6; Cs, 0.19-0.66; and Pb, 1.56-13.07. An inverse correlation between shell length and metal concentration was found for all metals but Pb. The author suggests that Donax trunculus should not be defined as an indicator of heavy metal pollution without a sampling program which includes the entire Israel coast. (Cassar-FRC)

SEDIMENT AND ORGANIC MATTER TRANSPORT IN OREGON COAST RANGE STREAMS,
Oregon State Univ., Corvallis. School of Forestry.
R. L. Beschta, S. J. O'Leary, R. E. Edwards, and K. D. Knoop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193914, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Oregon State University Report WRRI-70, February, 1981. 67 p, 20 Fig, 4 Tab, 49 Ref. OWRT-A-042-ORE(1), 14-34-0001-7078.

Descriptors: *Pollution load, *Sediment transport, *Organic matter, Streamflow, *Oregon, *Coastal streams, Mathematical equations, Environmental protection, Nonpoint pollution sources, Population exposure, Tractive forces, Sediment grading, Sediment concentration, Sediments, Aquatic soils, Water quality, Organic loading, Flow, Streamflow forecasting, Coastal waters, Rating flumes, Suspended solids, Turbidity, Particulate matter.

The overall objective of this study was to provide an improved understanding of sediment and organic matter movement in mountain streams, utilizing monitoring of two streams, Flynn Creek and Oak Creek, located in Central Oregon's Coast Range, for bedload transport, particulate organic matter transport, total suspended solids (TSS) concentration, and turbidity. Winter precipitation was relatively low during the 1976-1980 water years studied; frequency analysis indicated peak flows had recurrence intervals of less than two years. Rating curves were developed through the relationship that particulate transport equalled a constant times streamflow (Q) to some power. Exponential increases of 3.4-4.5 in bedload transport rates with increasing flows were measured using vortex tube and Helley-Smith bedload samplers. Sediment particle diameter averaged less than 0.5 and 2 mm for Flynn and Oak Creeks, respectively. Rating curves of TSS with Q varied highly, but exponential TSS increases with increasing Q were generally 1.1-1.6 when flow ranges were sampled. Hydrograph characteristics, Q, and the storm events sequence influenced TSS, which averaged about 60% inorganics and 40% organics. TSS correlated highly with turbidity, and both returned to relatively low levels within 24 hours after peak flow occurrences. (Zielinski-IPA)

MECHANISMS OF TRANSPORT OF COPPER, CADMIUM AND CHROMIUM IN SOILS,
California Univ., Davis. California Water Resources Center.
J. W. Biggar, K. K. Tanji, D. R. Nielsen, and R. J. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193922, Price codes: A05 in paper copy, A01 in microfiche. Completion Report, March, 1981. 81 p, 59 Fig, 10 Tab, 26 Ref. (California Water Research Project UCAL-WRC-W-511). OWRT-B-180-CAL(2).

Descriptors: *Pollution load, Soil analysis, Soil chemistry, *Soil contamination, *Heavy metals, *Path of pollutants, Soil dynamics, Soil environment, Soil adsorption capacity, Soil profiles, Soil

properties, Soil science, Soil tests, Soil types, Fate of pollutants, Trace metals, Copper, Cadmium, Chromium, Model studies.

Copper (Cu) in the saturation extract of dried Davis, California, sewage sludge was mainly in complexed form; the extent of complexation determined with a cupric specific ion electrode. Adsorption experiments showed a distribution coefficient (Kd) of 4.0 for complexed Cu on Yoho soil, while Cu added as cupric sulfate had a Kd of 90 cubic-centimeters/gram. The low Kd values on soil and the large percentage of complexed Cu suggested that sewage sludge may be a potential source of contamination of water and plant systems. A general model for trace metal adsorption was studied; an equation for multi-speciated metal adsorption was developed, accounting for both exchange and chemical adsorption. The model was compared with experimental data. Transport of cadium (Cd) in Hanford sandy loam and Yoho silt loam soil was studied using soil columns, adsorption/desorption curves, breakthrough curves (BTC) and the significant effects of EDTA and pH on position/shape of the BTC. A suitable model is lacking to describe the position/shapes of the BTC, but a model to describe batch reaction results was partially successful. (Zielinski-IPA)

Water Resources Research Center, University of the District of Columbia, Washington, Report No 13, November, 1979. 103 p, 23 Fig, 26 Tab, 34 Ref, 1 Append. OWRT-A-002-DC(1), 14-31-001-50502.

Descriptors: *Dissolved solids, *Urban runoff, *Particulate matter, *Organic carbon, Organic loading, Sediment transport, Cycling nutrients, Organic matter, Chemical analysis, Biological oxygen demand, Chemical oxygen demand, Pollution load, Streamflow, Water quality, Rivers, Suspended solids, River basins, River beds, Water analysis, Runoff, River flow, Surface runoff, Combined sewers, Effluent streams, *District of Columbia, Potomac River estuary, Anacostia River.

This project was undertaken to study the distribution, transport, seasonal cycling, and sources of dissolved organic carbon (DOC) and particulate organic carbon (POC) in the two subject District of Columbia area rivers, since rivers of high organic concentrations can have high BOD and COD values that lower oxygen concentrations to levels that can cause high mortality in aquatic life. DOC and POC concentrations were measured weekly for 17 main channel stations of the Upper Potomac River Estuary, and the distribution, production, transport and cycling of organic carbon was followed over a 12-month period. Special studies were conducted to evaluate the influence of tidal activity, flood storm crests and lateral variation on River DOC and POC levels. Mean DOC and POC levels reflected a seasonal and river mile sigmoid curve. DOC and POC transported annually by the Potomac to its Estuary were estimated at 54,000 and 37,000 metric tons, respectively. River DOC did not correlate with discharge, which POC does. DOC and POC levels in street runoff, storm and combined sewer overflows were 4-10 times higher than in Potomac River water. (Zielinski-IPA)

EFFECTS OF THE PROPOSED PROSPERITY RESERVOIR ON GROUND WATER AND WATER QUALITY IN LOWER CENTER CREEK BASIN, MISSOURI,
Geological Survey, Rolla, MO. Water Resources Div.
W. R. Berkas, and J. H. Barks.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-152621, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-88, November 1980. 29 p, 6 Fig, 9 Tab, 8 Ref.

Descriptors: *Reservoir sites, *Groundwater, *Water quality, *Surface-groundwater relationships, *Baseline studies, *Missouri, Karst, Base flow, Groundwater movement, Groundwater recharge, Water levels, Seepage, Tracers, Tracking techniques, Mine water, Zinc, Fertilizers, Nitrates, Nutrients, Center Creek basin(MO), *Prosperity Reservoir(MO).

Effects of the proposed Prosperity Reservoir on groundwater and water quality in lower Center Creek basin, Mo., depend partly on the effectiveness of Grove Creek as a hydrologic boundary between the reservoir site and the Oronogo-Duenweg mining belt. Results of two dye traces indicate that Grove Creek probably is not an effective boundary. Therefore, higher water levels near the reservoir could cause more groundwater to move into the mining belt and cause a greater discharge of zinc-laden mine water into Center Creek. Fertilizer industry wastes discharged into Grove Creek resulted in significant increases of nitrogen and phosphorus in lower Center Creek. Results of seepage runs confirm that mine-water discharge and seepage account for the increased zinc concentrations in Center Creek during base flow. The nutrient and zinc concentrations in Center Creek, after the completion of the proposed reservoir, would depend upon the release schedule. (USGS)

A WATER-QUALITY MONITORING NETWORK FOR VALLECITOS VALLEY, ALAMEDA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
C. D. Farrar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157034, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-59, October 1980. 22 p, 5 Fig, 2 Tab, 12 Ref.

Descriptors: *Water quality, *Monitoring, *California, *Radioactive wastes, *Radioisotopes, Path of pollutants, Water pollution sources, Effluents, Dissolved solids, Groundwater, Water wells, Sampling, Sites, Water analysis, Vallecitos Valley, Alameda County.

A water-quality monitoring network is proposed to detect the presence of and trace the movement of radioisotopes in the hydrologic system in the vicinity of the Vallecitos Nuclear Center, Alameda County, Calif. The source of the radioisotopes is treated industrial wastewater from the Vallecitos Nuclear Center that is discharged into an unnamed tributary of Vallecitos Creek. The effluent infiltrates the alluvium along the stream course, percolates downward to the water table, and mixes with the native ground water in the subsurface. The average daily discharge of effluent to the hydrologic system in 1978 was about 100,000 gallons. In Vallecitos Valley, the Livermore Gravel and the overlying alluvium constitute the groundwater reservoir. There is no subsurface inflow from adjacent groundwater basins. Groundwater flow in the Vallecitos subbasin is toward the southwest. The proposed network consists of four surface-water sampling sites and six wells to sample the groundwater system. Samples collected monthly at each site and analyzed for tritium and for alpha, beta, and gamma radiation would provide adequate data for monitoring. (USGS)

SEAWATER INTRUSION AND POTENTIAL YIELD OF AQUIFERS IN THE SOQUEL-APTOS AREA, SANTA CRUZ COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
K. S. Muir.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-168759, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-84, October 1980. 29 p, 19 Fig, 3 Tab, 2 Ref.

Descriptors: *Saline water intrusion, *Groundwater movement, *Water pollution sources, *Groundwater availability, *California, Water yield, Aquifers, Water wells, Pumping, Water level fluctuations, Monitoring, Observation wells, Water storage, Water utilization, Soquel-Aptos area, Santa Cruz County.

Seawater has intruded the Purisima Formation in the interval 0-100 feet below sea level in the Soquel-Aptos area. It occurs in the central part of the area and extends inland about half a mile. The potential yields of the two principal aquifers in the Soquel-Aptos area are 4,400 acre-feet per year from the Purisima Formation and 1,500 acre-feet per year from the Aromas Sand. Pumping from the Purisima Formation, averaging about 5,400 acre-feet per year since 1970, has caused water levels along the coast to decline below sea level and has allowed seawater to enter the aquifer. Seawater intrusion and ground-water storage could be monitored in all depth zones by expanding the observation-well network to include a number of shallow wells, one deep well inland from the coast, and three deep wells along the coast. CHEMICAL AND MINERALOGICAL COMPOSITION AND BEHAVIOR OF THE MANCOS SHALE AS A DIFFUSE SOURCE OF SALTS IN THE UPPER COLORADO RIVER BASIN,
California Univ., Davis. Dept. of Land, Air and Water Resources.
V. P. Evangelou.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-197626, Price codes: A11 in paper copy, A01 in microfiche. Ph.D. Dissertation, March, 1981. 198 p, 57 Fig, 26 Tab. (Water Resources Center Project UCAL-WRC-W-562). OWRT-B-201-CAL(1).

Descriptors: *Salinity, *Mineralogy, *Shales, Saline soils, Soil chemical properties, Water quality, *Colorado River Basin, Colorado River, Dolomite, Magnesium, Carbonates, West Salt Creek watershed, Colorado, Mancos Shale.

Previous investigations relative to salinity in the upper Colorado River Basin have mostly dealt with the total quantities of dissolved solids moving into the Colorado River. Soluble components resulting from dissolution of mineral species have been studied as separate physical entities in the Colorado River, in tributaries of the river and in the Mancos Shale formation. Thus, the Mancos shale itself has been treated basically as an inert material without consideration of possible interactions between soluble and insoluble phases. The purpose of this investigation is to conduct a thorough study of mineralogical and chemical characteristics of Mancos Shale itself has been treated basically as an inert material without consideration of possible interactions between soluble and insoluble phases. The purpose of this investigation is to conduct a thorough study of mineralogical and chemical characteristics of Mancos Shale within the West Salt Creek watershed, Colorado. The investigation focuses on the Mancos Shale as a source of soluble components contributing to salinity of the Colorado River including interactive relationships between the more soluble and less soluble mineral phases. The overall investigation has revealed the primary source of salts. Salts are derived from carbonates, calcite and dolomite, which upon contact with sulfuric acid (produced by the biological oxidation of pyrite), produce gypsum and magensium sulfates. A second source is gypsum as a product of the marine environment left after evaporation had occurred. A third source

is the continuous release of ions from such sources as dolomite, feldspars and micas. Finally, a fourth source is the leaching of ions of sodium and magnesium coming off the exchange complex of the unweathered Mancos Shale formation. (Snyder-California)

INTERCHANGE OF POLLUTANTS BETWEEN GROUNDWATER AND MINERAL STRATA AS APPLIED TO WASTE CHEMICAL DUMPS AND IN SITU COAL GASIFICATION SITES,
Missouri Univ.-Columbia. Dept. of Chemistry.
S. E. Manahan, P. Tobben, R. Gale, S. Hoeffner, and D. Bornhop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198335, Price codes: A02 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri, Completion Report, March 15, 1981. 16 p, 9 Fig. OWRT-A-117-MO(1), 14-34-0001-0127.

Descriptors: *Water pollution, *Hazardous wastes, Coal, Coal gasification, Char, *Waste dumps, Organic pollutants, Phenols, Chemical wastes, *Groundwater pollution, *Leachates.

The overall objective of this research was to study the interchange of pollutants between minerals and groundwater produced as leachate from waste chemical dumps and as a by-product of in situ (underground) coal gasification. Particular emphasis was placed upon the development of methods to evaluate the chemical interaction between contaminated groundwaters and specific solids so that these methods could be applied to specific situations which other investigators might need to study. Of particular importance was the development of methods to obtain chemical data which in turn can be used to provide meaningful bases for modelling groundwater contamination. Water contaminated by vapor from laboratory-simulated in situ coal gasification was employed as a model polluted water. The solids used to sorb organics from this waster were subbituminous coal, non-activated coal char, activated coal char, and coal ash.

EFFECTS OF FLY ASH HEAVY METALS ON DAPHNIA MAGNA,
Missouri Univ.-Kansas City. Dept. of Biology.
M. S. Stern, and D. H. Stern.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198327, Price codes: A04 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri, Columbia, Completion Report, December 30, 1980. 58 p, 9 Fig, 9 Tab, 62 Ref. OWRT-A-120-MO(1), 14-34-0001-9027.

Descriptors: *Fly ash, *Heavy metals, Daphnia magna, Cadmium, Bioassay, Bioaccumulation, Coal, *Water pollution effects, *Aquatic life.

The purpose of this study was threefold: (1) To analyze the concentrations of heavy metals released from two different fly ashes in alkaline Missouri waters and their effect on the pH; (2) to determine the LC sub 50 and the chronic toxicity concentrations of fly ash that killed or impaired the reproductive capacity of Daphnia magna; and (3) to study the possible bioaccumulation of cadmium from fly ash by D. magna. Results of acute toxicity tests with D. magna indicated that older daphnids tolerated higher concentrations of fly ash better than did juveniles. Unfed adults were more susceptible to the effects of fly ash from Illinois coal than were fed ones. The fly ash from the western coal affected both juveniles and adults very differently from the Illinois ash. There were no significant differences in LC sub 50 values between juveniles and adults or between fed and unfed daphnids. Toxicity effects from the western coal fly ash were expressed almost immediately, while effects from the other ash required several days. The total number of young produced was the most sensitive indicator of chronic toxicity. A comparison of 96-h acute data with 21-d chronic data for both ashes were not significantly different, thus indicating that cummulative toxicity was apparently not significant for these ashes. Cadmium was accumulated from both fly ashes by Daphnia magna. The greatest accumulation occurred in unfed adult daphnids after 96-h exposure. There was no additional total accumulation of cadmium in the 21-d daphnids when compared to fed 6-d old daphnids.

SIMULATION OF THE DISTRIBUTION OF POLLUTED WATER IN RESERVOIRS FROM CONCENTRATED EMISSIONS,
Gosudarstvennyi Gidrologicheskii Inst., Leningrad (USSR).
A. V. Karaushev, and V. V. Romanovskiy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, Michigan, Environmental Protection Agency Report 600/9-80-033, July 1980. p 12

Descriptors: *Simulation analysis, *Pollutants, Pollutant load, *Reservoirs, *Lakes, *Eddy diffusion, Water pollution sources, Turbulent flow, Reservoirs.

In periods of calm without unidirectional currents, or when the surface is ice-covered, patches of pollutants may develop in lakes and reservoirs around the emission point. The patch moves as a result of emission of new waste water and turbulent diffusion. The process of diffusion of pollutants can be simulated on the basis of a differential equation for turbulent diffusion in cylindrical coordinates. The equation can be used to determine diffusion from emission points at the shore or in an open body of water, and for conservative or non-conservative substances. From this equation, equations are developed for the calculation of the field of concentration. A series of calculations is required for each interval of time under consideration, and for conservative substances, the concentration value is verified based on calculation of the total mass of the substance. TRANSPORT OF MINING WASTE IN LAKE SUPERIOR,
Environmental Research Lab., Duluth, MN.
M. Sydor, G. E. Glass, and W. R. Swain.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80. p 180-196, 9 Fig, 3 Tab, 14 Ref.

Descriptors: *Particulate matter, *Mine wastes, *Mathematical models, *Satellite technology, *Lake Superior, Sediment transport, Remote sensing, Upwelling, Water pollution, Suspended solids, Model studies, Plumes, Turbidity, Wind, Water currents.

The western arm of Lake Superior has a 100 km trough which extends along the Minnesota shoreline from Knife River, Minnesota where the trough is 180 m deep past Silver Bay, Minnesota, where depths range around 250 m. An average of 67,000 tons of fine iron ore tailings are discharged at Silver Bay into the lake every day. The transport of particulates can be investigated through use of remote sensing and numerical modeling. Fine particulates in lakes are identifiable through use of Landsat data. For one wind episode, transport and dispersal of a plume is simulated numerically for the actual wind and pressure conditions over the lake. The model results are subsequently compared with measurements of suspended solids and the remote sensing data for the plume. The results show that the direct transport of tailings cannot readily account for the episodes of high concentration of tailings at the Duluth water intake. In the second example, Landsat images for two consecutive days show discrete high concentration patches of tailings which appear to have upwelled during westerly winds. The successive images and current measurements at two station show that tailing spatches are transported in accordance with the results from numerical models. The patches appear to have originated from an upwelling near the Duluth water intake. The data for the intake show that the concentration of tailings in the patches exceeded 3 mg/l, a level which is an order of magnitude higher than the concentrations produced by the direct transport of turbidity to Duluth. THE TRANSPORT OF CONTAMINANTS IN LAKE ERIE,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
W. Lick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. Environmental Protection Agency Report 600/9-80-033, Jul 80, p 261-305. 20 Fig, 33 Ref

Descriptors: Lakes, *Mathematical models, *Water pollution, *Water circulation, *Sediment transport, Model studies, Wave action, Pollutants, Sediment concentration, Stratification, Suspended sediments, *Lake Erie, Path of pollutants.

In order to understand more thoroughly and be able to predict the transport and fate of contaminants in lakes, the physical processes of transport have been studied in Lake Erie. The Western Basin of Lake Erie is quite wide but extremely shallow; because of this, and because of large inputs of sediments from the Maumee and Detroit Rivers and from shore erosion, there are large sediment concentrations and variations in sediment concentration in the Western Basin. These large variations in sediment concentration make the Western Basin particularly amenable to sediment transport analyses. The results of investigations of sediment resuspension and depostion, wave action, and currents were coupled with the sediment mass balance equation, and used to calculate the sediment concentrations during a specific, short-term event from 8 March to 11 March 1976 in the Western Basin. Near the southern shore there is reasonable agreement between the observations and calculations. In other areas, significant discrepancies exist. It is believed that the major reason for this is an inadequate knowledge of the sediment resuspension and deposition rates throughout the Basin. Transport in the Central Basin of Lake Erie during summer stratification was studied using a two-dimensional model. Calculations were made using a constant depth basin 100 km wide and 25 m deep, and a variable depth basin corresponding to a section across the Central Basin from Ashtabula, Ohio to Port Stanley, Ontario. The calculations are in reasonable agreement with observations. (Moore-SRC)

SELF-ORGANIZATION OF THREE-DIMENSIONAL MODELS OF WATER POLLUTION,
Akademiya Nauk URSR, Kiev.
A. G. Ivakhnenko, and G. I. Krotov.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80, p 306-342. 13 Fig, 6 Ref.

Descriptors: *Model studies, *Mathematical models, *Water pollution, *Computers, Mathematical studies, Computer models, Path of pollutants.

The basic shortcomings of the deductive method is the need for a priori production of sufficiently complete and accurate information on the subject. Imprecise knowledge of even a single characteris-

tic can make the result of modeling incorrect. According to the theorem of incompleteness of Godel, the so-called internal criteria utilized by deductive mathematics, are not suitable for selection of the structure of a model of optimal complexity. In contrast, external criteria pass through a minimum as the model becomes increasingly complex, and this minimum defines a model of optimal complexity. The new inductive method of modeling, self organization of models by computer, is directed toward comprehensively decreasing the volume of a priori information required for modeling. In contrast to deductive mathematics, methods of self-organization are based on the use of external criteria: regularity, minimum bias, balance of variables, convergence of a multi-step prediction, and combined criteria. The principle of self-organization can be formulated as follows: with gradual complication of models, finds this minimum and indicates the unique model of optimal complexity. (Moore-SRC)

THE DISTRIBUTION OF SEDIMENTS AND PARTICULATE CONTAMINANTS FROM COMBINED SEWER AND STORM DRAIN OVERFLOWS I SEATTLE'S NEARSHORE WATERS,
Municipality of Metropolitan Seattle-METRO, WA.
R. D. Tomlinson, B. N. Bebee, R. G. Swartz, S. Lazoff, and D. E. Spyridakis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche. In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, Nov 26-28, 1979, EPA Report EPA 600/9-80-056, December, 1980, p 115-146. 11 Fig, 5 Tab, 11 Ref.

Descriptors: *Storm runoff, *Storm wastewater, *Combined sewers, *Sediment distribution, *Lake Washington, Flow pattern, Particulate matter, Outfall sewers, Sediments, Heavy metals, Chlorinated hydrocarbons, Water pollution sources, Turbidity flow, Sediment transport, Storm sewers, Washington, Seattle area.

The locations and dimensions of the sewer outfalls in Lake Washington, Washington were mapped and measured. The map includes 23 emergency outfalls, 34 combined sewer outfalls (CSO's), 56 pump stations, and 240 storm drains (SD's). The analyses of sediments collected near 10 CSO's and 10 SD's revealed their widespread enrichment with heavy metals, chlorinated hydrocarbons and organic wastes. This was particularly true of the western nearshore region where all of the CSO's were located. Intensive comparative studies were carried out at one representative CSO and one SD having similar drainage basins and rainfall. Pollutant loading estimates indicated that, whereas mean storm concentrations for most parameters were greater for the CSO, the total annual loading was greater in most instances for the SD, due to its continuous and therefore greater volume of discharge. Effluent turbidity patterns and metals concentration ratios for effluent solids, settling particulates and sediments demonstrated significant local deposition of wastewater particles. The different effects of near-bottom, offshore transport and longshore advection cause different particulate dispersion patterns at the two sites. (Brambley-SRC)

EFFECTS OF COAL-ASH LEACHATE ON GROUND WATER QUALITY,
Tennessee Valley Authority, Chattanooga, TN.
J. D. Milligan, and R. J. Ruane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-178535, Price codes: A07 in paper copy, A01 in microfiche. Interagency Energy/Environment R & D Program Report, Environmental Protection Agency Report EPA-600/7-80-066, March 1980. 125 p, 28 Fig, 24 Tab, 30 Ref, 4 Append.

Descriptors: *Powerplants, *Settling basins, *Leaching, *Groundwater pollution, Soil types, Monitoring, Wells, Clays, Sand, Dissolved solids, Interstitial water, Water pollution sources, Industrial wastes, Coal-ash leachate.

A field and laboratory project was performed to characterize coal-ash leachate and its attenuation by selected soil types at two TVA power plants. Groundwater monitoring wells were installed around the ash ponds, continuous soil-core samples were collected and analyzed periodically, and ash leachate was percolated through different clays and soils to study attenuation rates. Ash leachate is a chemically reducing solution, usually acidic, with a variable composition characteristically high in total dissolved solids and boron, iron, calcium, aluminum and sulfate. The different coal sources in the study produced ash leachate with similar characteristics. Interstitial water samples contained higher concentrations of metals and were more acidic than well samples. The flux of metals in the ash pond leachate was negligible compared with the ash pond surface overflow. Soils containing a large percentage of clay provide a better medium for attenuating metals from ash leachate than do sandy soils. The use of an inert gas pump provided a means of collecting anoxic groundwater samples while minimizing oxidation. (Brambley-SRC)

COLIFORMS AND FECAL STREPTOCOCCUS IN THE ILLINOIS RIVER AT PEORIA, 1971-1976,
Illinois State Water Survey, Urbana.
S. D. Lin, and R. L. Evans.
Report of Investigation 93, 1980. 32 p, 7 Fig, 11 Tab, 36 Ref, 2 Append.

Descriptors: *Illinois, *Bacterial analysis, *Water pollution, *Water analysis, Water sampling, *Coliforms, Streptococcus, Bacteria, Feces, Chemical analysis, Time series analysis, Dissolved oxygen, Chemical composition, River systems.

Water samples were collected weekly from the Illinois River at Peoria and examined for total coliform (TC), fecal coliform (FC), fecal streptococcus (FS), and 17 chemical and physical parameters. Indicator bacteria, rather than pathogenic organisms, are used because of the laborious technique and expensive equipment required to isolate pathogenic organisms from water. The presence of coliform bacteria in water is generally regarded as evidence of pollution by warm-blooded animals. In the data obtained from June 1971 to May 1976, wide ranges of bacterial densities were observed. About 44% of the time, FC densities complied with the Illinois Pollution Control Board limit of no more than 200 FC per ml. Compliance with the rule that no more than 10% of the samples in a 30-day period may exceed 400 FC per ml. was achieved only 25% of the time. The latter rule was found to be the limiting factor. Approximately 7.1% of the TC densities consisted of FC. Based on FC/TC ratio values, fecal contamination derived from human sources occurred in 41% of the June-August samples. The FC/TC values were low in the winter and spring months and high in the summer and fall. A time series analysis was performed to show the trends, seasonal and cyclical indexes, and irregular factors for the bacterial densities. A surprise was that the bacterial quality of the Illinois River at Peoria is as good as, if not better than, that in one of its tributaries, the Spoon River. This suggests that the assimilative capacity of stream waters and nonpoint sources are important factors in assessing the bacterial quality of streams. (Garrison-Omniplan)

POLLUTION OF SEA WATER AND MARINE SEDIMENTS IN COASTAL AREAS,
Orleans Univ. (France).
S. Berne, M. Marchand, and L. D'Ozouville.
Ambio, Vol 9, No 6, p 287-293, 1980. 6 Fig, 3 Tab, 10 Ref.

Descriptors: *Sediments, *Sea water, *Amoco Cadiz, *Oil spills, Persistence, Water pollution effects, *Path of pollutants, Bottom sediments, Sands, Coasts, Beaches, Degradation(Decomposition), Oil pollution, *France, Tidal waters, Seashores, Tidal marshes, Marshes, Bays.

The path of oil pollution from the Amoco Cadiz spill was followed by analysis of water samples collected at depths from 1 to 20 meters and at 5 meters above the bottom, at different locations, and on different dates throughout the year following the accident. Pollution was widespread during the first month, but had returned to normal values after 3 months except for certain bays and abers. Sediment pollution reflected hydrocarbon contents of the water samples and direction of drift of the slick. Hydrocarbon levels decreased toward the open sea. Although the medium to fine sands were well decontaminated within a year (down to an average of 27 ppm), muddy and slimy sediments remained polluted (above 1000 ppm). The highest concentration after 1 year was greater than 10,000 ppm, measured in Aber Benoit and Loc Majan Cove. It is expected that pollution here may last 10 years. Decontamination was more rapid in areas exposed to wind and wave action, slower in sheltered sections of the coastline, marshes and abers. Pockets of oil remain in areas where oil was deposited during very high tides and where oil was buried by deposited sand. A table of vulnerability lists type of coast and sediment characteristics, method of pollution, factors affecting self-cleaning and human cleaning, and probable duration of pollution. (Cassar-FRC)

DISTRIBUTION OF ACTIVATION PRODUCTS FROM BARSEBACK NUCLEAR POWER PLANT (SWEDEN) IN THE MARINE ENVIRONMENT. TEMPORAL AND SPATIAL VARIATIONS AS ESTABLISHED BY SEAWEED,
Lund Univ. (Sweden), Dept. of Radiation Physics.
S. Mattsson, R. Finck, and M. Nilsson.
Environmental Pollution (Series B), Vol 1, No 2, p 105-115, 1980. 5 Fig, 1 Tab, 7 Ref.

Descriptors: *Nuclear powerplants, *Aquatic plants, *Radioisotopes, Bioindicators, Path of pollutants, Nuclear wastes, Seaweeds, Metals, *Sweden, Phaeophyta, Absorption, Marine plants.

The brown seaweeds, Fucus vesiculosus and Fucus serratus, were used as bioindicators to study the path of radionuclides discharged into the marine environment from a nuclear power plant on the Swedish coast. The degree of uptake per activity unit is ordered as follows: Mn54, Co58, Co60, and Zn65 greater than Ag110 greater than Cr51. Half lives of Co58, Co60, Mn54, and Zn65 were close to 60 plus or minus 15 days during the summer. About 85-80% of the radioactive material followed the northbound water stream and 10-15%, the southbound stream. An equation was developed relating the activity with distance north of the power plant outfall. (Cassar-FRC)

STUDIES ON THE PHOTOCHEMICAL DECOMPOSITION OF ORGANOMERCURIALS--METHYLMERCURY(II) CHLORIDE,
Yokohama National Univ. (Japan). Inst. of Environmental Science and Technology.
M. Inoko.
Environmental Pollution (Series B), Vol 2, No 1, p 3-10, January, 1981. 4 Fig, 1 Tab, 3 Ref.

Descriptors: *Mercury, *Chemical degradation, Degradation(Decomposition), Organomercury compounds, Ultraviolet radiation, Path of pollutants, *Methylmercury, Chemical reactions, Radiation.

Aqueous solutions of methyl mercuric chloride (10, 100, and 1000 micrograms per liter) were irradiated with ultraviolet light to determine the reaction products and kinetics. The initial decomposition reaction formed methyl and mercury chloride free radicals, which in turn produced ethane, mercurous chloride, methyl chloride, and metallic mercury. The reaction followed first-order kinetics, with a reduction rate constant of 0.6 per hour. This laboratory-derived data must be extrapolated cautiously to a natural aquatic environment, because the many other constituents present in natural systems could affect results. (Cassar-FRC)

Journal of Ecology, Vol 68, No 2, p 443-455, July, 1980. 2 Fig, 8 Tab, 28 Ref.

Descriptors: *Copper, *Lead, *Metals, *Aquatic plants, Plants, Sediments, Translocation, Heavy metals, *Lakes, Path of pollutants, Sorption, Ullswater Lake, Coniston Lake, Mine wastes, Water pollution sources, England.

Lead and copper uptake of 9 taxa of submerged aquatic macrophytes was studied in 2 English lakes, Ullswater and Coniston Water, both dimictic, temperate, oligotrophic-mesotrophic types. Mining of lead, zinc, and copper was begun about 1700 AD and continued to the present century. Mine seepage water still flows into these lakes. Lead and copper levels were 10-40 micrograms per cu dm in inflowing rivers and 0.5-5 micrograms per cu dm in the lake water. Sediment metal levels were higher and varied with site. Highest Pb level was 41,000 micrograms per gram dry weight; highest Cu level, 1500 micrograms per gram dry weight. Highest metal contents of plants were (in micrograms per gram dry weight): roots, Pb 1000 and Cu 720; shoots, Pb 1200 and Cu 510. It is believed that plants adsorb lead directly from the water, since some plants not rooted in the sediment took up lead. Copper uptake appears to be mainly from the roots with translocation to the shoots. Some absorption from water also can occur. (Cassar-FRC)

THE EFFECT OF BEEF FEEDLOT RUNOFF ON THE NITRATE-NITROGEN CONTENT OF A SHALLOW AQUIFER,
Kansas Agricultural Experiment Station, Manhattan. Evapotranspiration Lab.
R. V. Terry, W. L. Powers, R. V. Olson, L. S. Murphy, and R. M. Rubison.
Journal of Environmental Quality, Vol 10, No 1, p 22-26, January-March, 1981. 7 Fig, 3 Tab, 16 Ref.

Descriptors: *Aquifers, *Nitrates, *Feedlot runoff, Groundwater pollution, Water quality, Water analysis, Nitrogen, Farm wastes, Statistical analysis, Fluctuations, On-site investigations, *Kansas, Great Plains, Deep wells, Shallow wells.

The effects of different application rates of beef feedlot runoff on the nitrate-nitrogen levels of a shallow aquifer were evaluated in a subhumid region of the Great Plains of Kansas. Five application rates (0.0, 2.5, 5.1, 7.6 and 10.2 cm) were used in a randomized block design over 3 blocks. Samples of lagoon water were applied whenever precipitation produced sufficient runoff so that the lagoons had to be emptied. Every 3 months, water samples from a shallow and a deep well in each plot were collected and analyzed for nitrate-nitrogen. Statistical and graphical analysis of the data revealed that the nitrate-nitrogen levels in the shallow well of block 3 were as high as 46 milligrams/liter. Results from this well were also extremely variable. When the means from 12 quarters were statistically analyzed, only one significant treatment was found, in the seventh quarter. In most of the quarters, when the application rates were high, the lowest nitrate-nitrogen levels occurred in the aquifer. Parallel fluctuations were found in the nitrate-nitrogen levels using the dual well system. These findings suggested that some variations in nitrate-nitrogen levels stemmed from regional factors and not only from applied treatments. (Geiger-FRC)

GROUNDWATER CONTAMINATION POTENTIAL AT 21 INDUSTRIAL WASTE-WATER IMPOUNDMENTS IN OHIO,
Environmental Protection Agency, Columbus, OH Groundwater Div.
R. B. Stein, and J. A. Noyes.
Ground Water, Vol 19, No 1, p 70-80, January-February, 1981. 1 Fig.

Descriptors: *Groundwater pollution, *Industrial wastes, Water pollution sources, *Wastewater lagoons, Impoundments, Watersheds(Basins), Water table, Water sources, Groundwater basins, Aquifers, Water pollution, Water management(Applied), *Ohio.

Data are reported which deal with the current and potential contamination of groundwater sources at 21 industrial waste-water impoundments in Ohio. These 21 impoundment sites were selected by the House Subcommittee as having a high potential for contaminating local ground-water resources, as they are located in close proximity to the tops of highly permeable aquifer systems, thus allowing leakage or direct infiltration of wastes into the ground water; the waste waters in these impoundments may contain chemical substances classified as hazardous; there are no artificially placed barriers or liners beneath these impoundments; the sites are within one mile of a potential water supply well; and a very small percentage of industrial impoundments nationwide are being monitored for ground-water quality effects. These 21 industrial complexes include chemical companies, steel corporations, asphalt companies, incineration plants, a scrap lead plant, and other industrial classifications. The results of individual studies conducted at each of the impoundment sites are presented. (Baker-FRC)

WASTE IMPOUNDMENT ASSESSMENT IN THE STATE OF INDIANA,
SCS Engineers, Covington, KY.
J. J. Walsh, D. P. Gillespie, F. J. Schauf, and L. R. Silka.
Ground Water, Vol 19, No 1, p 81-87, January-February, 1981. 2 Fig, 9 Tab.

Descriptors: *Groundwater pollution, *Industrial wastes, Water management(Applied), Water pollution, Aquifers, Groundwater basins, Water sources, Water table, *Indiana, Watersheds(Basins), Impoundments, Water pollution sources, *Wastewater lagoons.

A study was made of waste impoundment in the state of Indiana for the purpose of inventorying waste impoundments located within the state and rating each waste impoundment on the basis of its ground-water contamination potential. The data that was gathered indicated that waste impoundments do possess high contamination potentials. One potential problem is the fact that the average depth to ground water at impoundment sites was only 13 ft, and about 20% of the impoundments were located on top of sand and gravel or limestone. In addition, 1,781 sites (94%) were located within 1 mile of water supplies; and 95 of these (5%) were located within 600 ft upgradient from drinking water wells. It is suggested that concrete examples of pollution of groundwater due to the surface impoundment of wastes will be reported as the use of the groundwater resources expands and new aquifers are tapped for use. BRINE POLLUTION AT FRESNO - TWENTY-SIX YEARS LATER,
K. D. Schmidt, J. A. Krancher, and G. Bisel, Jr.
Ground Water, Vol 19, No 1, p 12-19, January-February, 1981. 3 Fig, 4 Tab, 7 Ref.

Descriptors: *Brines, *Groundwater pollution, *Pollutants, Saline water, Ice-brine systems, Subsurface waters, Aquifers, Groundwater resources, Saline water intrusion, Water management(Applied), Chlorides, Halides, *Fresno, California.

In the early 1950's a case of groundwater pollution by chloride seeping into the water from pits and wells used for the disposal of waste waters at a Southern Pacific Railroad yard was reported. After the source of the pollution was identified, steps were taken to correct the situation. This paper reports on the situation as it stands now, 26 yr after the initial reports of the pollution. The point source of the pollution was an ice plant and water softening plant on the railroad yard. Discharge was stopped in 1953. In the late 1970's a high chloride content was still detectable in the ground water downgradient of the yard. The plume expanded both vertically and horizontally in the aquifer, from a volume of about 1,500 acre-feet in 1953 to 15,000 acre-feet in 1979. An inspection of chloride contents in water from specific wells in the late 1970's indicates that values from 150 to 175 mg/l were common immediately downgradient of the discharge site from the ice plant. One well producing water with a chloride content of 490 mg/l in the late 1970's was located about 1/2 mile from the former discharge site for the water softening plant. (Baker-FRC)

EVIDENCE FOR COMETABOLISM IN SEWAGE,
Cornell Univ., Ithaca, NY. Lab. of Soil Microbiology.
S. N. Jacobson, N. L. O'Mara, and M. Alexander.
Applied and Environmental Microbiology, Vol 40, No 5, p 917-921, November, 1980. 3 Tab, 21 Ref.

Descriptors: *Sewage bacteria, *Metabolism, *Herbicides, Model studies, Microbiological studies, Microbial degradation.

A method was developed to show cometabolism in models of natural ecosystems and to demonstrate cometabolism in sewage. The formation of metabolic products in high yield and the lack of incorporation of substrate carbon into cellular constituents are shown by the model. Samples of four C14 labeled herbicides (trifluralin, profuralin, fluchloralin, and nitrofen) were incubated with sewage aerobically and under discontinuous anaerobiosis for 88 days. Fresh sewage was added at intervals. In nonsterile sewage, products were formed from each of the herbicides. No products were formed in sterile sewage. Yield of recovered products was 87% for profluralin and more than 90% for fluchloralin and trifluralin. The number of products ranged from 6 for nitrofen to 12 for fluchloralin. When sewage microflora was concentrated 40-fold, the rate of conversion was greatly enhanced. Since the carbon substrate was not incorporated into the cells and the substrate was almost stoichiometrically converted to organic compounds, members of the microbial community were thought to be cometabolizing the test herbicides. PERSISTENCE OF SPILLED OIL IN A TEXAS SALT MARSH,
Texas Univ. at Port Aransas. Marine Science Inst.
S. A. Macko, P. L. Parker, and A. V. Botello.
Environmental Pollution (Series B), Vol 2, No 2, p 119-128, 1981. 6 Fig, 19 Ref.

Descriptors: *Oil spills, *Coastal marshes, *Path of pollutants, Salt marshes, Water pollution sources, Oil pollution, Chemical properties, Tracking techniques, *Texas.

A crude oil spill at Harbor Island, Texas, was analyzed to determine the persistence of oil in a salt marsh system. There was a rapid loss of low molecular weight alkanes and more volatile aromatics. Concentrations of higher molecular weight n-alkanes (greater than C22) and of the alkyl-substituted naphthalenes and phenanthrenes de-

creased slowly to background levels. Over the 24-month period of the study, only slight differences were noted in the carbon isotopic composition of the whole crude extract when compared with original oil. The isotopic ratio was quite stable, which is indicative of its value for the tracking of petroleum pollutants. Concentration decreases were extrapolated to indicate that baseline levels will not be achieved until another five years. The spill investigated was a small spill (377 barrels of Brega crude) under harsh conditions. The possible longterm effects of a larger spill could be much more severe. (Small-FRC)

FATE OF CHROMIUM IN A TRIBUTARY OF THE IRAJA RIVER, RIO DE JANEIRO,
Universidade Federal do Rio de Janeiro (Brazil). Inst. de Biofisica.
W. C. Pfeiffer, M. Fiszman, and N. Carbonell.
Environmental Pollution (Series B), Vol 1, No 2, p 117-126, 1980. 2 Fig, 3 Tab, 18 Ref.

Descriptors: *Plating industry, *Chromium, *Industrial wastes, *Path of pollutants, Rio de Janeiro, *Brazil, Guanabara Bay, Iraja River, Water analysis, Heavy metals, Metals, Water pollution sources, Adsorption, Sediments.

Chromium released by an elctroplating industry into a tributary of the Iraja River, Rio de Janeiro, was determined in water, bottom sediments, and suspended particles during seven months at five stations. The average monthly Cr release was 537 kg, with concentrations varying from 370 to 4482 mg per ml. Hexavalent Cr represented 87% and trivalent, 13%. Total Cr concentrations in water dropped rapidly with distance from the outfall, from a mean of 54 and 80 ppm at the two closest stations to 6 and 0.23 ppm respectively, 300 and 600 meters downstream. Upstream levels were 0.14 ppm. Mean sediment samples varied from 1420 ppm Cr upstream to 24820 and 54300 ppm near the outfall and 5440 and 1700 ppm further downstream. Total Cr levels in suspended particles were 2210 ppm upstream, 15260 and 61070 near the outfall, and 27370 and 18620 downstream. The highest single Cr level was 227000 ppm in a suspended particle sample closest to the outfall. At 150 meters from the effluent release point, hexavalent Cr was predominant. At the station 300 meters downstream, domestic sewage entered the river, producing reducing conditions and a higher proportion of trivalent Cr. (Cassar-FRC)

RELATIVE DEGRADATION RATES OF NTA, EDTA AND DTPA AND ENVIRONMENTAL IMPLICATIONS,
Princeton Univ., NJ. Dept. of Geological and Geophysical Sciences.
J. L. Means, T. Kucak, and D. A. Crerar.
Environmental Pollution (Series B), Vol 1, No 1, p 45-60, 1980. 4 Fig, 2 Tab, 46 Ref.

Descriptors: *Biodegradation, *Nitrilotriacetic acid, Ethylenediaminetriacetic acid, Diethylenetriaminepentaacetic acid, Chelation, *Heavy metals, Degradation(Decomposition), *Path of pollutants, Chemical reactions, Water pollution sources, Environmental effects, Organic compounds.

Chelating agents in the environment are undesirable, even at very low concentrations, because they solubilize and promote the transport of toxic and radioactive heavy metals in the ground and in natural waters. This study measured biodegradation rates of nitrilotriacetic acid (NTA), ethylenediaminetetraacetic acid (EDTA), and diethylenetriaminepentaacetic acid (DTPA) under different chemical conditions. Biodegradation rates decreased in the order NTA>EDTA = DTPA. Total degradation rates were DTPA>EDTA>NTA over the short term and NTA = DTPA>EDTA over the long term. Photolysis was noticeable in DTPA. Degradation rates decreased with decreasing oxidation-reduction potential and increased with addition of nutrients. After 173 days, total degradations of the three chelates were: greater than 99% for NTA and DTPA, and 92-99% for EDTA. The author suggests that chelates be destroyed by thermal or chemical means such as ozonation prior to discharge into the environment to prevent the danger of heavy metal mobilization. (Cassar-FRC)

ACID LAKES FROM NATURAL AND ANTHROPOGENIC CAUSES,
Academy of Natural Sciences, Philadelphia, PA. Div. of Limnology and Ecology.
R. Patrick, V. P. Binetti, and S. G. Halterman.
Science, Vol 211, No 4481, p 446-448, January 30, 1981. 7 Fig, 26 Ref.

Descriptors: *Coals, *Acidic water, *Lakes, *Acid rain, Water pollution sources, Water pollution effects, Fuels, Burning, Air pollution, Oil, Humic acids, Limnology.

Although the total amount of coal used in the U.S. has not significantly increased since 1920, changes in use patterns and pollution technology have altered the nature and quantity of stack emissions. This situation has produced acid rains and increasing acidity in many lakes in the northeastern U.S. Factors contributing to more acid emissions from fossil fuel burning are: (1) increase in the proportion of coal consumed by utilities, (2) gradual increase in use of fly ash precipitators, which remove the neutralizing effect of ash upon sulfur and nitrogen oxides, (3) the fact that sulfur scrubbers are only required on coal-burning plants built since 1975, (4) increase in the height of stacks, which introduces emissions high into the atmosphere where they can be readily transported for long distances (5) use of hotter combustion flames and resultant increase in nitrogen oxides emitted since 1975, (6) increase in use of petroleum in utilities and transportation where emissions are not controlled. Aquatic life in naturally acid lakes does not appear to suffer greatly from increases in acidity because the high humate content tends to chelate toxic metals released by the acid. However, lakes without this protective effect show more serious ecological disturbances. (Cassar-FRC)

BIODEGRADATION OF CHEMICALS OF ENVIRONMENTAL CONCERN,
Cornell Univ., Ithaca, NY. Dept. of Agronomy.
M. Alexander.
Science, Vol 211, No 4478, p 132-138, January 9, 1981. 1 Fig, 3 Tab, 91 Ref.

Descriptors: *Biodegradation, *Organic compounds, *Microorganisms, Chemical reactions, Persistence, Pesticides, Microbial degradation, Chemicals, Water pollution sources, *Path of pollutants, Environmental effects, Cometabolism, Chelation, Ecology, Reviews, Resistance, Enzymes, Soil contamination.

Microbial activity is the major process in complete degradation, or mineralization, of organic compounds such as pesticides in water and soil. This literature review describes the mechanisms of biological degradation, including cometabolism, and the toxic intermediates often formed from relatively innocuous precursors, e.g., methyl Hg from inorganic Hg in sediments. One table lists 16 types of reactions for transformation of environmentally important chemicals. Examples are dehalogenation (DDT), epoxidation (heptachlor), and sulfur oxidation (aldicarb). A second table lists 13 types of reactions for cleavage of organic chemicals. Examples of such chemicals are esters (malathion, phthalates) and S-S compounds (thiram). A third table shows examples of seven conjugation reactions involving, not degradation, but transformation. Examples are methylation of pentachlorophenol and N-nitrosation of dimethyl amine. Recalcitrant molecules, or molecules resistant to degradation (some synthetic polymers, pesticides, chlorinated aromatics, etc.) are discussed. These compounds may be esthetically undesirable, undergo biomagnification in the food chain, be transported in waters, and be very difficult to remove from the environment. Reasons for resistance to degradation are absence of oxygen in the medium, structure of the molecule, absence of any suitable organism or enzyme, low temperature, and complexing. (Cassar-FRC)

Descriptors: *Enewetak Atoll, *Path of pollutants, *Organic compounds, Polychlorinated biphenyls, Air pollution, Baseline studies, Pesticides, Pacific Ocean, Water pollution sources, Oceans, Plasticizers, Chlorinated hydrocarbon pesticides, DDE, Chlordane, Dieldrin.

The levels of selected organic pollutants present in rain and air of Enewetak Atoll, North Pacific Ocean, an area remote from human and industrial activity, were measured in April to August 1979, to determine an ambient or minimum worldwide pollutant level. Some averaged pollutant concentrations in rainfall (in nanograms per liter) were as follows: polychlorinated biphenyls, less than 0.6; hexachlorobenzene, less than 0.03; alpha-hexachlorocyclohexane, 3.11; gamma-hexachlorocyclohexane, 0.51; chlordane, dieldrin, and DDE, less than 0.02; di-n-butyl phthalate, 21; and di(2-ethylhexyl)phthalate, 55. Atmospheric residence times showed that rain was not the only factor involved in removing pollutants from the air. Vapor phase deposition into the sea surface may be the controlling factor. PHOSPHORUS AND NITROGEN IN THE MEDITERRANEAN SEA: BUDGETS AND POTENTIAL FERTILITY. (LE PHOSPHORE ET L'AZOTE EN MER MEDITERRANEE, BILANS ET FERTILITE POTENTIELLE),
Station Marine, Villefrance-sur-Mer (France). Lab. de Physique et Chimie Marines.
J. P. Bethoux.
Marine Chemistry, Vol 10, No 2, p 141-158, 1981. 6 Fig, 1 Tab, 21 Ref.

Descriptors: *Phosphorus, *Nitrogen, *Mediterranean Sea, Nutrients, Water pollution sources, Cycling nutrients, Path of pollutants.

Terrestrial discharges of phosphorus and nitrogen into the Mediterranean Sea are considered along with the calculated values of water fluxes. Only low concentrations of phosphorus are found in the surface layers of the water. The phosphorus cycle in the Mediterranean is characterized by the transfer of the terrestrial and Atlantic influxes from the surface to the intermediate and deep layers. The geographic distribution of terrestrial discharges is extremely asymmetric, with vertical movements of water masses in specific areas inducing an important hydrologic recycling of the phosphorus. The potential fertility is estimated from the local surface phosphorus flows and from the hydrologic recycling. The nitrogen budget in the Mediterranean should be comparable to that of phosphorus, as the geographical variations of the nitrate concentrations in the deep waters and the distribution of terrestrial discharges are similar. However, the relatively low values of terrestrial discharges of

nitrogen that have been proposed do not allow a balance of this nutrient unless a high concentration is introduced in the Atlantic surface waters. (Baker-FRC)

HYDROCARBON-UTILISING MICRO-ORGANISMS FROM DONA PAULA BAY, GOA,
National Inst. of Oceanography, Panaji (India).
N. B. Bhosle, and S. Mavinkurve.
Marine Environmental Research, Vol 4, No 1, p 53-58, 1980-81. 4 Tab, 14 Ref.

Descriptors: *Microorganisms, *Bacteria, *Organic compounds, Oil pollution, *Hydrocarbons, Biodegradation, Water pollution treatment, Water pollution sources, Path of pollutants, Marine microorganisms, Yeasts, Oil spills, Goa, Dona Paula Bay, *India.

Twenty-three strains of bacteria and one yeast were isolated from water and sediment samples in Dona Paula Bay, Goa. Most predominant were Vibrio and Pseudomonas. These were grown on a variety of hydrocarbons and hydrocarbon mixtures--kerosene, motor oil, Arabian Sea crude, furnance oil, aviation turbine fuel, raw naphtha, gasoline, diesel, tar, n-pentane, n-hexane, cyclohexane, n-heptane, benzene, xylene, toluene, naphthalene, and anthracene. Bacillus, Candida, and Arthrobacter sp. utilized the greatest number of hydrocarbon materials. Arabian Sea crude and kerosene supported the growth of most of the isolates. Pentane, benzene, naphthalene, and anthracene accelerated growth of most of the microorganisms. (Cassar-FRC)

HEALTH HAZARDS AND POLLUTION FROM OPEN DRAINS IN A NIGERIAN CITY,
Ibadan Univ. (Nigeria). Dept. of Preventive Medicine and Social Medicine.
M. K. C. Sridhar, P. A. Oluwande, and A. O. Okubadejo.
Ambio, Vol 10, No 1, p 29-33, 1981. 4 Fig, 4 Tab, 20 Ref.

Descriptors: *Public health, *Waste water(Pollution), *Domestic wastes, Diseases, Drains, Sewage disposal, Water pollution sources, Ibadan, *Nigeria, Wastes, Municipal wastes, Sewage, Water quality, Cities, Microbiology, Coliforms, Parasitism, Human diseases.

Wastewater from kitchens, bathrooms, and laundries in the city of Ibadan, Nigeria, is commonly carried in open drains, which are a source of environmental pollution and health hazards. Samples of waste water were collected in areas of high-, medium-, and low-density population. Most severe pollution was seen in the samples from the most crowded sections of the city, 350-430 persons per hectare. Ranges of results were as follows: pH, 6.4-7.5; turbidity, 50-1000 Fermazin units; total solids, 112-11,544 mg per liter; suspended solids, 20-1,150 mg per liter; 4 hour permanganate value, 25-61.9 mg per liter; BOD, 30-980 mg per liter; dissolved oxygen, 0-0.6 mg per liter; NH3, 20-800 mg per liter; mean total coliforms, 18,000,000 per 100 ml; and fecal coliforms, 800-16,000 per 100 ml. Sediment samples (500 g) from one sandy open drain showed an average of 3,400 Ascaris sp. ova and 300 hookworm larvae. Waste water samples contained a variety of pathogens and parasites: Staphylococcus aureus, fecal coliforms, Trichomonas sp., Balantidium coli, Giardia intestinalis, Entamoeba histolytica, Candida albicans, Ascaris sp. ova, larvae of hookworm Ancylostoma sp., miracidia of Schistosoma sp., and Stronglyloidess sp. Although waste water drains are capable of self-purification after flowing 16-40 km, the drains of Ibadan enter streams before much improvement in quality occurs. This situation produces severe stream and groundwater pollution. (Cassar-FRC)

5C. Effects Of Pollution

HYDROCHEMICAL AND GEOPHYSICAL INVESTIGATION OF THE EFFECTS OF FLY-ASH DISPOSAL ON GROUNDWATER,
Wisconsin Univ.-Madison. Water Resources Center.
D. S. Cherkauer, and W. F. Kean.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-197592,Price codes: A05 in paper copy, A01 in microfiche. Technical Completion Report WIS WRC 80-12, 1980. 85 p, 32 Fig, 7 Tab, 43 Ref, 1 Append. OWRT-A-077-WIS(1), 14-34-001-8053, 9053.

Descriptors: *Groundwater, *Chemical wastes, *Water pollution effects, *Fly ash, *Leachate, *Landfills, Pollutant identification, Geophysics, Wisconsin, Waste disposal, Earth fill, Solid wastes, Water pollution souces, Water pollution, Water quality, Calcium, Magnesium, Sodium, Potassium, Iron, Manganese, Nickel, Zinc, Inorganic compounds, Research and development, Analytical techniques.

The effects of landfill disposal of fly ash on groundwater and methods useful to monitoring such impact were investigated. Hydrochemical and geophysical monitoring of a fly ash landfill site in Ozaukee County, Wisconsin and related laboratory experiments were carried out. The landfill disposal method is the only method presently used in Southeastern Wisconsin. Landfill disposal of fly ash allowed generation of an acidic leachate highly concentrated with Ca, Mg, Na, K, sulfate, and several metals (Fe, Mn, Ni, Zn). Fly ash disposal in contact with an unconfirmed sand aquifer resulted in development of a traceable leachate plume in the aquifer. The plume contained water severely contaminated with Ca, Mg, and sulfate, and bicarbonate concentrations were high due to dissolution of the dolomite-rich sand. Leachate contamination was released in a pronounced 'first flush' pattern immediately after disposal of new ash. Reactions between the carbonate-rich aquifer sand, marsh peat, and the leachate rapidly ameliorated the contamination effects. Heavy metals were, in general, undetected outside the fill boundaries. Major ions (except ca and bicarbonate) were rapidly reduced in concentration downflow. Electrical resistivity methods were useful for identifying the extent of leachate contamination in a shallow aquifer and for tracing its migration and seasonal changes. (Zielinski-IPA)

MECHANISMS BY WHICH ACID PRECIPITATION PRODUCES EMBRYONIC DEATH IN AQUATIC VERTEBRATES,
Cornell Univ., Ithaca, NY.
F. H. Pough.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198392, Price codes: A02 in paper copy, A01 in microfiche. Center for Environmental Research, Cornell University, Completion Report. March, 1981. 13 p, 4 Tab, 21 Ref. OWRT-A-077-NY(2), 14-34-0001-7068, 8034, 9034, 0134.

Descriptors: Acid precipitation, Embryology, *Amphibians, Experimental studies, *Acid rain, *Toxicity, Fish, Frogs, Ponds, *Lakes, Embroyonic growth stage, Hydrogen ion concentration, Ambystoma jeffersonianum, Ambystoma maculatum, Rana sylvatica, Xenopus laevis, Teratogenesis.

Fourteen species of amphibians show a general similarity in their tolerance of acid media during embryonic development. More than 85% mortality is produced by pHs of 3.7 to 3.9 and more than 50% mortality occurs at pHs of 4.0 or less. Similar values have been reported for fishes. The sensitivity of amphibian embryos to acidity is greater in late stages of their development than it is during the initial cleavage of the embryos. The teratogenic effects of acidity appear to be the result of damage to the superficial tissues of the embryo. A similar response occurs in fish embryos. Because of the similarity of sensitivity and response to acidity of fishes and amphibians, the latter animals are suitable experimental models for investigations of the details of acid resistance. Controlled breedings of African clawed frogs (Xenopus laevis) indicated that the offspring of some pairs of parents were more resistant to acidity than those of other pairs. Wild populations of spotted salamanders (Ambystoma maculatum) breeding in some ponds in the Ithaca, New York, region have probably been exposed to increasingly acid conditions for the past three decades (10 or more generations). In the most acid ponds more than 70% of the embryos die before hatching. Despite the intensity and duration of this selection, it was not possible to demonstrate any difference in sensitivity to acidity between eggs collected from acidic and neutral breeding sites.

THE NITROGEN CYCLE IN THE DELAWARE RIVER,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
R. B. Tiedemann, T. J. Tuffey, J. V. Hunter, and J. Cirello.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198400. Water Resources Research Institute, Rutgers University Completion Report, February, 1981. 67 p, 12 Fig, 24 Tab, 10 Ref. OWRT-B-054-NJ(2), 14-31-0001-5091.

Descriptors: *Nitrogen cycle, *Nitrification, *Estuarine environment, Delaware, *Bacterial analysis, Bacteria, Estuaries, Environment, River systems, Rivers, Nitrogen fixing bacteria, Aquatic bacteria, Aquatic life, Aquatic populations, Water quality, Nitrogen compounds, Nitrites, Nitrates, Imparied water quality, Water pollution effects, *Delaware River.

The research scope was divided into two phases: (1) a review of existing literature on the estuary concerning nitrification; (2) transfer of ammonia and nitrate across the mud-water interface. The first phase was expanded to include studies of the role of nitrification inhibition and particulates. Indirect evidence (nitrogen species data) obtained from U.S. Environmental Protection Agency Storet data indicated that significant nitrification occurs within the estuary. These observations were confirmed by the present study. Number counts of nitrifying organisms indicated that the changes observed in the ammonia-nitrogen, nitrite-nitrogen, and nitrate-nitrogen concentrations could be attributed to the organisms present, due to the long retention times. Nitrification was observed to proceed at a maximum rate during June-October and a zone of nitrification inhibition was observed in the vicinity of the city of Philadelphia. Two nitrifying regions were identified: one in the upper estuary, one in the lower, with the latter shifting upstream during warm water months. Of the chemical and microbiological parameters measured, only pH, dissolved oxygen and suspended solids varied considerably with estuary location and/or depth. (Zielinski-IPA)

Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, Michigan. Environmental Protection Agency Report 600/9-80-033, July 1980. p 71-84, 4

Descriptors: *Water pollution sources, *Ecosystems, Experimental data, Prediction, Water use, Surface runoff, Precipitation, Lake morphology, *Model studies, Lake Baikal, *Russia.

At present, anthropogenic effects on the ecosystem of Lake Baikal are minimal. Possible effects can be judged using models for long-term prediction. The lake is used as a source of water for consumption, the culture and harvesting of fish and for recreation. The major pollutant sources are surface runoff and atmospheric precipitation. Numerical hydrodynamic calculations and field observations of current speed and direction were used in the modeling of the hydrochemical regime. The basis of the models for the dynamics of the concentrations of substances entering the lake is the equation of turbulent diffusion of a non-conservative impurity. Two groups of equations are used to develop a model based on the dynamic balance method, one group reflecting the productive nature of the system and the other the dynamic nature. In addition to its primary function as a predictive instrument, the model can act as a connecting link between various branches of limnologic study of Lake Baikal, and indicate areas where information is incomplete. A REVIEW OF SOME METHODS AND PARAMETERS USED IN ASSESSING EFFECTS OF WATER INTAKES ON FISH POPULATIONS,
Michigan Univ., Ann Arbor. School of Natural Resources.
R. L. Patterson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980, p 237-251, 1 Fig, 16 Ref.

Descriptors: *Fish populations, *Mortality, *Intakes, *Entrainment, *Population dynamics, Aquatic populations, Larvae, Aquatic habitats, Environmental effects, Food chains.

The direct effects of water intakes on fish populations consist of entrainment, and impingement. Direct effects upon sections of the aquatic habitat may be triggered by withdrawal of excessive quantities of water, which may affect recruitment or survival of the species inhabiting the area. Indirect effects include: imbalance in food chains due to size or species selectivity in cropping, and the loss in new recruits in subsequent years due to cropping of individuals in the present year. Factors important in assessing the effects of water intakes include: historical review, mortality rates of entrained larvae, size distribution of entrained larvae, total number of entrained larvae, total number and size distribution of impinged individuals, percent reduction in size or age classes due to entrainment and impingement, and the vulnerability of larval populations to entrainment. An assessment of direct effects is complicated by the need to obtain larval production and natural mortality estimates as well as estimates of standing crops of other size classes, and the differential impact that a particular water intake may exert if it selectively crops size classes, and the implications of this differential cropping of size classes upon the percent reduction in the population. A SPATIALLY-SEGMENTED MULTI-CLASS PHYTOPLANKTON MODEL FOR SAGINAW BAY, LAKE HURON,
Environmental Research Lab.-Duluth, Grosse Ile., MI. Large Lakes Research Station.
V. J. Bierman, Jr., and D. M. Dolan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80, p 343-365. 16 Fig, 1 Tab, 5 Ref.

Descriptors: *Phytoplankton, *Eutrophication, *Model studies, *Mathematical models, *Lake Huron, Water quality, Water chemistry, Zooplankton, Nutrients, Phosphorus, Nitrogen, Silicon, Chlorophyll, Chloride, Water pollution.

The principle water uses in Saginaw Bay include municipal and industrial water supply, waterborne transportation, recreation, commercial fishing, and waste assimilation. These uses are severly impacted by the considerable quantities of waste discharges and runoff to the bay. The purpose of the modeling effort was to develop a deterministic phytoplankton simulation model that could describe the cause-effect connection between external nutrient loading and phytoplankton growth in Saginaw Bay. Analyses were conducted for 22 different physical-chemical variables, including phosphorus, nitrogen, silicon, chlorophyll, chloride, temperature, and Secchi depth. Biological measurements included species identification and number concentrations for both phytoplankton and zooplankton. These field data are used to perform a preliminary calibration for the phytoplankton modeling effort. The field data indicate that there are large gradients in water quality among five spatial segments in Saginaw Bay. These gradients have a strong impact on the model development effect because it is difficult to obtain a unified set of kinetics which can describe phytoplankton dynamics simultaneously in all five segments. URBAN RUNOFF RECEIVING WATER IMPACTS: PROGRAM OVERVIEW AND RESEARCH NEEDS,
Municipal Environmental Research Lab., Edison, NJ. Storm and Combined Sewer Section.
R. Field, and R. Turkeltaub.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche. In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, Nov 26-28, 79, EPA Report EPA 600/9-80-056, Dec 80, p 8-30. 11 Fig, 4 Tab, 22 Ref.

Descriptors: *Storm runoff, *Storm wastewater, *Combined sewer overflows, *Urban runoff, Research priorities, Water pollution sources, Water pollution control, Dissolved oxygen, Pathogens, Nutrients, Aquatic life, Poisons, Water quality standards, Monitoring, High flow.

Uncontrolled stormwater and combined sewer overflows are a major cause of pollution of receiving waters. Data on the environmental impacts of urban stormwater and combined sewer overflow are being gathered by projects of the Storm and Combined Sewer Program of the EPA's Municipal Environmental Research Laboratory as a first step in developing control needs and a methodology to quantify pollutant stress and evaluate the impact in relation to receiving water standards and desired uses. Ongoing projects include studies on dissolved oxygen depletion with particular reference to sediment oxygen demand; pathogen concentrations; nutrients; aquatic biological communities; and toxic substances. Control methodology will be based on some site-specific factors, but general studies are valuable. They include projects to review case studies of documented receiving water impacts; to develop a methodology for defining criteria for wet-weather water quality standards; and to develop a user's manual/guidebook for wet-weather flow quality and quantity monitoring. AN APPROACH FOR ASSESSING THE WATER QUALITY SIGNIFICANCE OF CHEMICAL CONTAMINANTS IN URBAN LAKES,
Colorado State Univ., Fort Collins.
G. F. Lee, and R. A. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche. In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, EPA Report EPA 600/9-80-056, Dec 80, p 32-57. 6 Fig, 26 Ref.

Descriptors: *Urban runoff, *Eutrophic lakes, Phosphates, *Nutrients, *Contamination, Water pollution control, Eutrophication, Storm water, Water quality, Macrophytes, Dredging, Chemical precipitation, Nitrogen, Lakes, Urban lakes.

Increasing pressures are being placed on water pollution control agencies to manage water quality in urban lakes. A major problem to be overcome is the excess nitrogen and phosphorus which enter the lake from urban runoff. Since only 10-30% of the particulate phosphorus present in urban stormwater is likely to become available to affect algal growth, attention should be directed to the soluble orthophosphate component, yet most current stormwater drainage control programs are directed to particulate control. A study conducted by the Organization for Economic Cooperation and Development which models eutrophication can be used to describe the nutrient load-response relationships for the urban lakes and to estimate the magnitude of water quality improvement that will arise as a result of altering the nutrient loads in phosphorus limited urban lakes. Improved water quality may be achieved by: removal of debris and trash left by users of the area; control of macrophytes by herbicides or harvesting; dredging of sediment; and direct addition of alum to precipitate phosphate in incoming waters. THE EFFECT OF URBAN STORMWATER RUNOFF ON THE WATER QUALITY OF LAKE JACKSON, FLORIDA,
Florida State Univ., Tallahassee. Dept. of Oceanography.
C. Byrne, C. R. Donahue, and W. C. Burnett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche. In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, EPA Report EPA 600/9-80-056, December 1980, p 58-71. 4 Fig, 2 Tab, 15 Ref.

Descriptors: *Urban runoff, Storm surges, *Storm runoff, *Lakes, *Hydrocarbons, Petroleum products, Particulate matter, Dissolved solids, Water quality, Water pollution sources, Water sheds, *Lake Jackson, Florida.

The presence of petroleum hydrocarbons in the stormwater runoff to the Meginniss Arm of Lake Jackson during a storm event was investigated and the concentration and forms of these hydrocarbons assessed as they move through the discharge channel and into the lake. Water grab samples were taken at intervals after the storm at four locations on 27 November, 1978. Dissolved and particulate hydrocarbon fractions were determined using gas-liquid chromatography. The dissolved hydrocarbon fraction ranged from 18-71 ppb, with a significant maximum 2 hours after the storm event. The total particulate hydrocarbon concentrations ranged from 37-16,365 ppb, with the maximum at the beginning of the storm, and a secondary maximum 2 hours into the storm. The presence of petroleum hydrocarbons is indicated by the low Carbon Preference Index (<1.5) and the occurrence of an unresolved hydrocarbon envelope in the chromatograms. Comparison of the runoff from this highly urban watershed with that from a primarily forest-agriculture watershed may make possible a separation of the biogenic and anthropogenic pollution sources. This information could contribute to determination of a mass balance for hydrocarbons in the lake. (Brambley-SRC)

In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, EPA Report EPA 600/9-80-056, Dec 80, p 72-88. 4 Fig, 3 Tab, 14 Ref.

Descriptors: *Urban runoff, *Agricultural runoff, Phosphorus, Rainfall-runoff relationships, Nitrogen, *Skinner Lake, Indiana, *Lake Lansing, Michigan, *Nutrients, Watersheds, Limiting nutrients, Eutrophication, Lakes, Phytoplankton, Water pollution sources, Water pollution control, Lake Michigan basin.

To compare the watershed types with respect to the ability to maintain phytoplankton productivity in a lake throughout the summer, comprehensive watershed studies were conducted in Lake Lansing and Skinner Lake in the Lake Michigan drainage system from March to October, 1979. During that interval, large differences in storm-related nutrient loading were measured from urban, wetland, and agricultural sources. Eliminating runoff due to melt of the snow pack, it was found that rain-related discharge from the urban area studied was 0.578 kg total-P and 3.688 kg total-N per hectare. Rain induced runoff from marshes in the same drainage basin transported 0.023 kg total-P and 0.585 kg total-N per hectare. Rainfall of approximately the same amount caused runoff from agricultural land of 0.180 kg total-P and 5.965 kg total-N per hectare. Algae of both lakes were phosphorus limited; nitrogen was present in excess. Using constants from Nichols-Dillon relationships in the literature regarding phosphorus, phytoplankton biomass, and secchi disc transparencies, the urban input of phosphorus per hectare of drainage was sufficient to bring 0.96 ha-m lake water to undesirable algal bloom status. Similarly, marsh input per hactare would bring an estimated 0.04 ha-m into bloom. By the same calculation, storm-related agricultural runoff would result in 0.30 ha-m of lake water becoming undesirably rich in algae. Knowing the number of hectares in these types of catchment and the volume available in a particular lake for phytoplankton production, decisions regarding cost-effective treatment of rain-related discharge can be made. Descriptors: *Lake Conway(FL), *Stormwater runoff, *Nutrients, Nitrogen, Phosphorus, *Mesotrophic lakes, Eutrophication, Algal growth, Zooplankton, Water pollution sources, Water quality, Storm seepage, Precipitation, *Florida.

The Lake Conway system is an interconnected series of three lakes with similar physical, chemical and biological features which vary in stormwater loadings and are relatively free of other pollution inputs. It is therefore suitable for studying the effect of stormwater on water quality and biota. Both nitrogen (2.6 g-N per sq. m per year) and phosphorus (0.22 g-P per sq m per year) inputs were within the range of loadings that leads to mesotrophic conditions. The major external sources of both elements were atmospheric inputs, stormwater runoff and subsurface seepage. Multivariate analysis of water quality data by discriminant analysis showed differences among the three lakes of the Conway system. Seasonal trends in several water quality indicators varied concomitantly with changes in external nutrient loadings, especially with those from residential stormwater runoff. Those lakes that had a proportionately larger share of phosphorus loadings from stormwater runoff showed a degradation in water quality. Strong linear relationships were found between watershed area to lake area ratios and stormwater phosphorus loadings; stormwater phosphorus loadings and Secchi disk transparency; and chlorophyll a and total zooplankton numbers. Increased stormwater flow into the lakes is associated with decreased water quality, and larger algal and zooplankton populations. (Brambley-SRC)

THE ECOLOGICAL EFFECTS OF URBAN RUNOFF ON STREAM COMMUNITIES,
Tetra Tech, Inc., Lafayette, CA.
D. B. Porcella.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, EPA Report EPA 600/9-80-056, December 1980, p 147-166. 4 Fig, 5 Tab, 20 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Ecological effects, *Ecosystems, *Stream biota, *Stream pollution, Streams, Evaluation, Aquatic plants, Macroinvertebrates, Monitoring, Water pollution sources, Water pollution control.

Materials in urban runoff impact streams in several specific and unique ways that distinguish those impacts from other linked systems. A literature review of the ecological effects of urban runoff on streams indicates a dearth of principles for evaluating the impact of urban runoff or any pollutant on streams, and a serious lack of studies that determine urban runoff impacts on communities of stream ecosystems. It can be concluded from the case studies that macroinvertebrates and periphyton seem to be effective for monitoring impulse impacts on streams; that diversity and biomass are often used for the analysis of monitoring data but they are not always adequately sensitive; and that water quality variables do not always reflect stream impacts directly but the biota must also be assessed. Consideration of three studies of ecological effects of storm runoff lead to the hypothesis that large scale variations and instabilities of stream pollutant input and concentration would result in lesser impact to stream communities than steady imputs. Time and space measurements of structurally and functionally defined biomass, photosynthesis, respiration, and diversity would be used to determine the ecological impact of the runoff loadings, leading to the development of management strategies. ANALYSIS OF RECEIVING STREAM IMPACTS ON THE MILWAUKEE RIVER,
EcolSciences, Inc., Milwaukee, WI.
T. L. Meinholz.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 168-196, 16 Fig, 1 Tab.

Descriptors: *Combined sewers, *Storm sewers, *Model studies, *Combined sewer overflows, *Dissolved oxygen, Scour, Lake Michigan, Bottom sediment, Prediction, Evaluation, Water pollution control, Cost-benefit analysis, Coliforms, Monitoring, *Milwaukee River, Wisconsin.

Extensive monitoring and modeling efforts were performed to quantify the receiving water impacts of the combined sewers on the Milwaukee River, Milwaukee, Wisconsin. The models used were the EPA's SWMM and the Corps of Engineers' STORM models. The inflow of Lake Michigan into the river was a major difficulty in the modeling. Final model calibration using a linearly decreasing flux was found to match the continuous dissolved oxygen (DO) data generated during two years of record. Field monitoring showed that the cause of the large DO sags in the lower reaches of the river following runoff events are due to bottom sediments scoured out by the submerged combined sewer outfalls. The receiving water model was modified to include an expression which would predict the extent and duration of the scour action from the submerged outfalls. Long term simulations of DO and other parameters were calibrated and verified using the response of the river to a multitude of rainfall events. The use of this model network in the evaluation of possible actions for abating combined sewer overflows produced magnitudes of DO and fecal coliform impacts for each action using 20 yrs of rainfall record. Cost-benefit analyses were performed for: existing conditions; partial separation; complete separation; out of basin (storage-conveyance-treatment); end of pipe; and 100% combined sewer outflow removal. URBAN STORMWATER IMPACTS ON RECEIVING STREAMS IN NORTH CAROLINA,
North Carolina Dept. of Natural Resources and Community Development, Raleigh. Div. of Environmental Management.
E. R. Brown, and R. S. Green.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-155426, Price codes: A99 in paper copy, A01 in microfiche.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, FL., Nov 26-28, 1979, EPA Report EPA 600/9-80-056, December, 1980. p 197-222, 11 Fig, 8 Tab, 15 Ref.

Descriptors: *Urban runoff, *Storm sewers, *Storm overflow sewers, *Stream degradation, *Stream biota, Water quality standards, Monitoring, Macroinvertebrates, Nutrients, Heavy metals, Aquatic animals, High flow, Suspended solids, Urban watersheds, Water pollution control, *North Carolina.

To determine the extent of water quality degradation in streams receiving urban stormwater runoff, selected streams were monitored in three of the larger urban areas within the state; Asheville, Raleigh, and Winston-Salem. The monitoring program involved physical/chemical sampling under both high (storm) and low streamflow conditions. Parameters sampled include pH, temperature, DO, five day BOD, COD, fecal coliform, ammonia-nitrogen, total Kjeldahl nitrogen, nitrite plus nitrate nitrogen, total phosphorus, iron, mercury, lead, zinc, copper, cadmium, chromium, nickel and solids. Biological sampling of aquatic benthic macroinvertebrates was conducted concurrently to further document water quality conditions. All of the urban streams exhibited extensive water quality problems. Physical/chemical sampling consistently revealed high pollutant concentrations for several parameters under high flow conditions. Notable problematic parameters included suspended solids, lead, and some nutrients. Several parameters were frequently present in high concentrations under low flow conditions also. Variations in pollutant concentrations from the different land use types were also observed. All of the urban streams monitored were found to be extensively biologically degraded. Populations of Diptera and Oligochaeta, pollution-tolerant organisms, averaged over 90% of the existing fauna. In contrast, control station population percentages of these organisms were a maximum of 15% of the fauna in the mountain stream, and 35% in Piedmont streams. Many intolerant groups were not just reduced in numbers in the urban streams; they were usually completely absent. Under present conditions, almost all urban streams will be unable to meet the 1983 water quality goals. Improvement of water quality conditions in these streams is dependent upon the development of programs to effectively manage the

entry of pollutants from urban land surfaces and unrecorded or intermittent point sources.

DISSOLVED OXYGEN IMPACT FROM URBAN STORM RUNOFF,
Sutron Corp., Arlington, VA.
T. N. Keefer, R. K. Simons, and R. S. McQuivey.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 223-244, 4 Fig, 2 Ref.

Descriptors: *Urban runoff, *Dissolved oxygen, *Storm runoff, *Water quality standards, Monitoring, Rainfall, Urban areas, Data processing, Water pollution sources, Statistical analysis.

Records from 104 water quality monitoring sites throughout the country were considered to determine whether a correlation exists between strength of dissolved oxygen (DO) deficit and the presence of rainfall and/or storm runoff in and downstream of urban areas. Daily data were obtained and processed for 83 of the sites. At 24 of the sites low DO correlated with flow, and at 18 sites with rainfall. This correlation was obtained by considering daily data for the entire water years, but did not occur every year. Oxygen levels of 5 mg/1 or less were not uncommon. Detailed hourly data analysis was made at 22 of the sites with high correlation between flow and DO deficit. Eleven of these would not meet a 5.0 mg/1 DO standard; six of the eleven would not meet the EPA-suggested standard of 2.0 mg/1 for 4 hr. The exact cause of the increase in DO deficit is not obvious in most cases. Violations of water quality standards appear to be infrequent. (Brambley-SRC)
W81-02757

THE IMPACT OF COMBINED SEWER OVERFLOWS ON THE DISSOLVED OXYGEN CONCENTRATION OF A SMALL STREAM,
Aalborg Univ., Denmark. Dept. of Environmental Engineering.
T. Hvitved-Jacobsen.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 245-259, 9 Fig, 9 Ref.

Descriptors: *Combined sewer overflows, *Dissolved oxygen, *Water pollution, Stream pollution, Storm waste water, Water quality, Storm runoff, Biochemical oxygen demand, Benthos, Organic matter, *Denmark, Jutland, Skravad Brook.

Towns of 1,000-10,000 inhabitants often must discharge municipal waste water and stormwater to a small stream with a flow of 50-500 1/sec. During intensive storms, the flow may be increased several hundred percent. The discharged water from combined sewers may be a potential source for undesirable impact on the dissolved oxygen in the stream. The different oxygen consumption processes in receiving streams were studied at four stations in Skravad Brook in Jutland, Denmark, during and after the passage of storm overflows. Two different effects on the dissolved oxygen concentration were observed in the stream: an immediate effect, and a delayed effect. The immediate effect is caused by degradation of the soluble biochemical oxygen demand fraction in the water and by direct absorption of organic matter by bottom invertebrates. A delayed effect is caused by degradation of the adsorbed colloidal and settling particulate matter. The delayed degradation may increase the respiration of the bottom about 100%. This delayed effect may last 12-24 hours after the discharge event. The oxygen consumption of the organic matter input to the stream by a storm overflow is spread over a long period compared to time of passage of the polluted volume. This effect appears to be essential for evaluation and design of sewage systems within urban areas. (Moore-SRC)

IMPACTS OF INTERMITTENT URBAN DISCHARGES ON RECEIVING WATERS,
Manhattan Coll., Bronx, NY.
J. L. Mancini.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 261-280, 8 Fig, 6 Tab, 6 Ref.

Descriptors: *Combined sewer overflows, *Water pollution, *Urban runoff, *Storm runoff, Beaches, Coliforms, Water quality, Water pollution control, Rainfall, Storm waste water, Stream flow, Toxicity, New York.

The impacts of combined sewer overflow discharges on bathing beach areas of New York City are investigated, and the treatment and costs for controlling water quality are defined. Calculated and observed time variable coliform distribution over several storm events are presented for the major water bodies that make up New York harbor. The results of the analysis indicate that discharges within 4 to 6 miles of the beach required control and treatment, while those further away from the areas to be protected had smaller effects on coliform levels at the beach, and treatment was not required to meet existing coliform standards. The cost of controls, even on this scale, are substantial and could represent 200 million dollars. One method for defining critical wet weather events has been identified and can be considered for use in developing frequency information which could provide a part of the basis for wet weather quality criteria. In its most generalized form the approach could consider hourly rainfall and stream flow records, variable runoff coefficients, and variable constituent concentrations as a function of rainfall intensity or volume. In the case of biological effects of instream concentrations of contaminants, it is necessary to consider the time of exposure in addition to the concentration of the contaminant. This is due to the transient nature of the intermittent loads from storm runoff events. (Moore-SRC)

THE RESPONSE OF GREAT LAKES ESTUARIES TO STORMWATER RUNOFF,
Corps of Engineers, Buffalo, NY. Buffalo District.
J. R. Adams, and S. M. Yaksich.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 281-300, 14 Fig, 2 Tab, 1 Ref.

Descriptors: *Storm runoff, *Storm water, *Water pollution, *River flow, Water quality, Water chemistry, Urban runoff, River mouth, Estuarine environment, Lake stages, Seasonal variation, Water pollution sources, *Great Lakes estuaries, Lake Erie, Maumee River.

Glacial rebound of the northern shore of Lake Erie has resulted in drowned rivermouths of southern shore tributaries. Transport of material through these estuaries depends not only on river stage but also lake stage. Three separate studies of water chemistry in the lower Maumee River were conducted during 1974 and 1975. Base flow river conditions and the resultant estuary chemical variations were measured during the summer of 1974, and winter storm runoff effects were measured during January and February 1975. Additional sampling and analysis were conducted during the summer of 1975, giving a fairly complete record of water chemistry variability. Winter storm runoff was also measured in the estuary of the Cuyahoga River, with simultaneous river and estuary sampling over the hydrograph for selected pollutants. This analysis demonstrates that the estuarine reach of the Maumee River is impacted by pollutants generated in the remainder of the basin, and that the water quality problems in the Toledo urban area are not solely the results of Toledo's own pollution of the river. Inputs of pollutants to the river during even moderately small summer storms can be considerably larger than inputs from Toledo. Impacts are increased by the fact that the entire volume of such summer storms does little more than replace a single volume of the estuarine volume. This polluted water often becomes stagnant in the estuary. In warm weather these events multiply to severely degrade the quality of water in the Maumee River. (Moore-SRC)

WATER QUALITY AND URBAN RUNOFF IN SELECTED CANAL COMMUNITIES ALONG THE TEXAS COAST,
Hays and Lindsey, Inc., Austin, TX.
A. L. Messenger, and T. D. Reynolds.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 301-322, 9 Fig, 1 Tab, 10 Ref.

Descriptors: *Water quality, *Urban runoff, *Canals, *Rainfall, *Texas, Land development, Wastewater, Dissolved oxygen, Streeter-Phelps equations, Nutrients, Pesticides, Suspension, Sediments, Model studies, Storm runoff.

Water and runoff samples from seven waterfront communities in the Galveston Bay area were collected and analyzed in order to evaluate causes of canal water quality problems. Until present, community design has been based on optimum utilization of land area with little or no regard toward the effect of development on water quality. The primary cause of water quality problems in these communities appears to be urban runoff. Samples of canal waters were collected over a five-month period and analyzed for nutrients, oxygen demand, pesticides, and hydrological variables, including Rhodamine dye concentrations. In general, canal waters exerted BOD5 values of 2-10 mg/1 with no problems associated with toxic substances. Evaluation of domestic wastewater data from centralized treatment facilities indicates that these wastewater streams are not major sources of pollution loading. Runoff samples were collected from three rainfall-runoff events and were found to contain significant amounts of carbonaceous material. Also, the possibility of canal sediment resuspension by point discharge of runoff was investigated using a canal model. The two-year frequency rainfall event for the Galveston area was found to produce significant resuspension of high BOD5 benthic sediments. These data were applied using the modified Streeter-Phelps equations for estuarine dissolved oxygen analysis and were found to fit actual conditions with reasonable accuracy. (Authors' abstract)

THE RESPONSE OF SUBTIDAL INFAUNAL COMMUNITIES TO A CHANGE IN WASTEWATER DISCHARGE,
Washington Univ., Seattle. Coll. of Fisheries.
R. M. Thom, and K. K. Chew.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 324-340, 8 Fig, 1 Tab, 16 Ref.

Descriptors: *Combined sewer overflows, *Storm waste water, *Water pollution, *Fauna, Waste water, Rainfall, Marine animals, Urban runoff, Invertebrates, Estuarine environment, Polychaetes, Crustaceans, Species diversity, Water depth, *Seattle, Washington, Puget Sound.

During rainy periods, sewage treatment plants in Seattle, Washington, become overloaded and some of the material in the sewers is released through combined sewer overflows (CSO). The CSO discharging the greatest volume of sewage into marine waters in Seattle is located at Denny Way in Elliot Bay, Puget Sound. The impact of this ephemeral source of raw waste water and street runoff on the macroinfaunal communities was evaluated using samples taken after periods of highest (April) and lowest (August) frequency of discharge. In April, the community nearest the overflow was characterized by a high number of indi-

viduals, a low number of taxa, a low species diversity, a high abundance of the polychaete Capitella capitata, and a high relative number of polychaetes. There was an area of markedly low infaunal abundance bordering the region of acute impact. Diversity and number of taxa were highest at the sites furthest from the overflow. The samples in August showed similar trends relative to the overflow in number of individuals, number of taxa, species diversity and community composition by species, phyla, and feeding type. Differences among all sites in these parameters were less pronounced during this period. A notable difference was the switch in numerical dominance to the leptostracan crustacean Nebalia pugettensis at the site nearest the overflow. A cluster analysis indicated that depth was of primary importance, and that the CSO was of secondary in producing among site differences. (Moore-SRC)

PRODUCTIVITY RESPONSES OF LAKE EOLA TO URBAN RUNOFF,
University of Central Florida, Orlando. Dept. of Civil Engineering and Environmental Science.
H. H. Harper, III, Y. A. Yousef, and M. P. Wanielista.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 341-370, 7 Fig, 10 Tab, 13 Ref.

Descriptors: *Productivity, *Storm runoff, *Urban runoff, *Water pollution, *Eutrophication, Nutrients, Phosphorus, Dissolved oxygen, Nitrogen, Sediments, Heavy metals, Algal growth, Bioassay, Wastewater management, Lakes, Florida, *Lake Eola.

Lake Eola is a land-locked lake located in downtown Orlando, Florida. It is a focal point for the city and is visited by many tourists for its aesthetic appeal. From all indications, both visually and analytically, Lake Eola appears to be a lake in severe ecological distress. Persistent algal blooms exist virtually year round. Concentrations of dissolved oxygen, although usually at or above saturation near the surface drop periodically during the spring and summer months to less than 1 mg/l in deep areas of 4.0 m or more water column. Phosphorus from the bottom sediments was released up to a level of 250 mg/square m after two months of anoxic conditions. Bioassay experiments were utilized to study the impact of stormwater runoff, untreated and coagulated on productivity of Lake Eola water. It is concluded that management of stormwater runoff is essential if restoration of Lake Eola is to be successful. Considerable amounts of nutrients are released by stormwater runoff. Phosphorus is probably the most important nutrient in regulation algal production in Lake Eola. From bioassay experimentation, stormwater up to 25% mixture with lake water will enhance algal productivity. A mixture of lake water and dry weather flow from storm drains did not produce changes in algal production. If stormwater runoff is coagulated with alum before its release to the lake, no significant increase in algal production will be produced. Stormwater contains heavy metals and organic compounds which may be in concentrations toxic to algal species in lake water. (Moore-SRC)

WATER QUALITY AND BIOLOGICAL DEGRADATION IN AN URBAN CREEK,
Woodward Clyde Consultants, San Francisco, CA.
R. Pitt, and M. Bozeman.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 371-405, 5 Fig, 19 Tab, 14 Ref.

Descriptors: *Urban runoff, *Water pollution, *Aquatic animals, *Storm runoff, *Water pollution sources, Heavy metals, Nutrients, Nitrogen, Lead, Feces, Fertilizers, *California, Coyote Creek, San Jose.

Coyote Creek, near San Jose, California is being studied to determine the effects of urban runoff on water quality and biological organisms in the creek. Most of the urban runoff pollutants are soluble, and can be carried in the water columns of receiving waters. Almost all (95%) of the lead compounds present in urban runoff are expected to be insoluble particulates. Non-urban stations are affected by runoff from undeveloped and agricultural areas, and urban stations are affected by runoff from those areas as well as the runoff from urban areas. Urban runoff pollutant sources include: lawn and landscaped areas, vacant lots, rooftops, sidewalks, parking lots, and street surfaces. Vacant land and landscaped areas are among the most pervious surfaces in urban areas and are located farthest from urban drainage systems, therefore they contribute only a small fraction of the pollutants. Street surfaces are located very close to the storm drainage system and are almost impervious. They comprise about 15-20% of the study area, and most of the runoff is expected to reach the outfall. Automobile activity is responsible for most of the heavy metal yield in the runoff and about half of the total solids yield. Vegetation sources contribute most of the oxygen-demanding materials, while animal feces and fertilizers are thought to contribute most of the nitrogen in urban runoff. Preliminary biological investigations in Coyote Creek have indicated distinct differences in the taxonomic composition and relative abundance of the aquatic biota present in various reaches of the stream. The non-urban sections of the creek support a comparatively diverse assemblage, including 12 species of fish, and various benthic macroinvertebrates. The urban portions comprise an aquatic community that is generally lacking in diversity and is dominated by pollution-tolerant organisms. (Moore-SRC)

NATIONWIDE ASSESSMENT OF URBAN STORMWATER POLLUTION IMPACTS ON RECEIVING WATER BODIES,
Florida Univ., Gainesville.
J. P. Heaney, W. C. Huber, and M. E. Lehman.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 407-436, 2 Fig, 5 Tab, 18 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Water pollution, *Literature review, Fishkill, Water quality, Beaches, Environmental effects, Storm water, Water pollution sources.

The projected costs for abating urban stormwater pollution through elimination or reduction of discharges range in the billions of dollars. This has forced a look beyond abatement of discharges to the receiving water bodies for insights as to what are the impacts, where are they, and are they significant. A study was undertaken to inventory documented receiving water impacts from urban runoff on a nationwide basis. The search for documentation included published and unpublished literature, Section 201 and Section 208 projects (PL92-500), EPA-furnished project materials, EPA fish kill data files, National Urban Runoff Program Proposals, and miscellaneous water quality reports and permit files. Impacts due to stormwater runoff can be defined at three levels: policy or master plan violations; criteria or standards violations; and actual environmental degradation or loss of beneficial use, such as fish kills and beach closings. Findings to date indicate that documented case studies of impacts of urban runoff on receiving waters are scarce. Most cases of documented impacts were made for minor receiving water bodies. Large water bodies tended to have sufficient dilution, adequate flushing or multiple source imputs which obscure impact differentiation. The significance of stormwater impacts on receiving water bodies cannot be assessed at this time. The sparseness of documented cases, the lack of detailed data, and the general focus of stormwater investigations do not provide a substantial basis for determinations. (Moore-SRC)

STATISTICS OF RECEIVING WATER RESPONSE TO RUNOFF,
Manhattan Coll., Bronx, NY. Environmental Engineering and Science Program.
D. M. DiToro.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 437-465, 10 Fig, 1 Tab, 12 Ref, 1 Append.

Descriptors: *Runoff, *Storm runoff, *Water pollution, *Statistical methods, Combined sewer overflows, Storm waste water, Mathematical models, Mathematical studies, Rainfall, Dissolved oxygen, Biochemical oxygen demand.

The analysis of receiving water responses to intermittent discharges from separate and combined sewer overflows is a problem of substantial difficulty. The problem setting is inherently time variable due to the transient mass discharges, and although a time variable integration of the mass balance equations describing the receiving water response is possible, it is an unwieldy and laborious undertaking. An analysis is presented for the mean and variance of a one dimensional advective dispersive system that is subjected to random inputs of runoff. Analytical solutions are available for which the mass input is represented as a Poisson process of delta functions. The effects of event to event variability of runoff mass discharges are included in the formulation as are the random times between overflows. The method of solution evaluates the overlapping effects in the receiving water due to the persistence of discharged mass. Both conservative, first order reactants, and sequentially reacting substances are considered. The solutions have certain unexpected properties. In particular, the normalized variance of biological oxygen demand and dissolved oxygen are symmetric about the discharge point, whereas the means of the concentration are not. This is explained in terms of the effects of advection and dispersion of fluctuations. The analytical solutions are compared to simulated results using an observed hourly rainfall sequence. The results indicate that the within event variability is not significant, if the receiving water dispersion is large enough. It is also pointed out that treatment devices such as retention basins which remove a certain average fraction of the overflowing mass are less effective in removing variance in the receiving water. This phenomenon is of importance in the evaluation of the probable benefit of runoff treatment. (Moore-SRC)

CONTINUOUS RECEIVING WATER QUALITY MODELING FOR URBAN STORMWATER MANAGEMENT,
Duke Univ., Durham, NC. Dept. of Civil Engineering.
M. A. Medina, Jr.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 466-501, 9 Fig, 2 Tab, 18 Ref, 2 Append, R-802411.

Descriptors: *Urban runoff, *Waste water treatment, *Storm waste water, *Water pollution, *Mathematical models, Model studies, Water quality, Dissolved oxygen, Storm runoff, Rainfall, Iowa, Des Moines River.

A simplified continuous receiving water quality model has been developed as a planning guide to permit preliminary screening of areawide waste water treatment strategies. The model simulates the hypothetical response of the stream or tidal river system to the separate and combined effects of waste inputs from: (1) upstream sources, (2) dry weather urban sources, and (3) wet weather urban sources. The total hours of runoff-producing rainfall throughout a year are separated into storm events by defining a minimum inter-event time. For a given storm event, the runoff and pollutant loads are summed and critical dissolved oxygen concentrations are estimated as a function of sever-

al hydrodynamic and biochemical parameters. Alternative control strategies are evaluated in terms of relative impacts by determining the probability of occurrence of water quality violations. Model output includes the downstream dissolved oxygen sag curves computed per each event, and the dissolved oxygen profile computed at a user-specified location downstream for all simulated events. An application to the Des Moines River at Des Moines, Iowa, is presented. (Author's abstract)

POTENTIAL OF URBAN STORMWATER IMPACTS BASED ON COMPARATIVE ANALYSIS OF WET AND DRY WEATHER POLLUTANT LOADS,
Municipal Environmental Research Lab., Edison, NJ. Storm and Combined Sewer Section.
D. Ammon, and R. Field.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 502-522, 5 Fig, 14 Tab, 32 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Combined sewer overflows, *Water pollution, Storm waste water, Heavy metals, Biochemical oxygen demand, Chemical oxygen demand, Hydrocarbons.

Urban stormwater discharges and combined sewer overflows are significant contributors of many pollutants to receiving waters. Summaries of urban wet-weather characterization data are presented for several groups of parameters including heavy metals, petroleum hydrocarbons, biochemical oxygen demand (BOD) and chemical oxygen demand. Comparisons are presented between the pollutant loads from urban wet-weather discharges and from publicly owned treatment works effluents to indicate the relative importance of each source. Combined sewer overflows are calculated to contribute about 380 lb/acre/yr of BOD, which is about 28% of the annual load from the combined sewered area with no treatment of the dry-weather flow. In separate sewered areas, urban stormwater discharges contribute about 70 lb/acre/yr of BOD, which is about 45% of the annual BOD load if secondary treatment is provided for the dry-weather flow. The relative magnitudes of urban wet-weather loads compared to the publicly owned treatment works discharges are much greater during and following storm events. Several heavy metals occur in sufficient concentrations in urban stormwater discharges and combined sewer overflows to exceed quality criteria even with many dilutions. Load comparisons show that urban wet-weather discharges contribute more of several metals, such as cadmium, chromium and lead, to receiving waters than treatment works effluents. Urban stormwater and combined sewer overflows contribute significant portions of oil and grease, and petroleum hydrocarbons to the environment. (Moore-SRC)

THE USE OF RECEIVING WATER QUALITY MODELS IN URBAN RUNOFF POLLUTION ABATEMENT: APPLICATION TO MARGINAL BENEFIT - MARGINAL COST ANALYSIS,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
C. B. Murphy, Jr., G. J. Welter, D. A. MacArthur, and R. P. Canale.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 524-556, 16 Fig, 2 Tab, 4 Ref.

Descriptors: *Urban runoff, *Water pollution, *Model studies, *Cost-benefit analysis, Water quality, Storm waste water, Storm runoff, Combined sewers, Water pollution control, Combined sewer overflows, Hydrological regime, Temperature.

Urban storm runoff has been determined by a number of investigators to represent a significant portion of the water pollution problem and abatement of this source has been recognized as a necessary consideration in achieving the national water quality goals. However, due to the highly irregular nature of the runoff phenomenon abatement measures that address this problem tend to be expensive and difficult to size. Using ongoing studies of combined sewer systems in Rochester, New York and Washington, D. C., as case studies, a procedure is presented for the application of receiving water analyses in urban runoff planning. The studies in both areas have included the development of water quality models based on familiar concepts of mass balance and calibrated against detailed field surveys and laboratory experiments. In an analysis of marginal costs and marginal benefits associated with various combined sewer overflow abatement alternatives, a series of model runs are made to project the impact of various waste discharges from the alternate system configurations on the receiving waters under several hydrologic regimes and ambient temperatures. The conjoint probabilities of the receiving water conditions and storm loads are determined on the basis of historical records and used to project the expected water quality under the alternative system configurations. These projections can be quantified as water quality improvements in terms of expected degree of contravention of stream standards with regards to frequency, duration, areal extent and peak concentration. On the basis of this analysis of project cost estimates drawn from generalized cost curves, marginal costs and benefits can be displayed graphically for each alternative. (Moore-SRC)

METHODOLOGY FOR EVALUATING THE IMPACT AND ABATEMENT OF COMBINED SEWER OVERFLOWS, A CASE STUDY OF ONONDAGA LAKE, NEW YORK,
Stearns and Wheler, Cazenovia, NY.
P. E. Moffa, J. C. Byron, S. D. Freedman, J. M. Karanik, and R. Ott.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December, 1980. p 557-589, 14 Fig, 3 Tab, 18 Ref. R805096010.

Descriptors: *Combined sewer overflows, *Storm runoff, *Water pollution, *Mathematical models, Model studies, Urban runoff, Dissolved oxygen, Phosphorus, Computer models, Recreation, Coliforms, Rainfall, Cost analysis.

A general methodology is presented for the evaluation of the impact and abatement of combined sewer overflows on receiving waters. It was developed from experience with Onondaga Lake in Central New York which receives combined sewer overflows from the City of Syracuse. Field investigations of the combined sewer system and the receiving water must first be undertaken. Use of a computerized data bank has been found virtually essential for the storage and manipulation of the large quantity of data resulting from the sampling and analysis. Mathematical modeling of the receiving water is undertaken to evaluate water quality as a function of pollutant load; the storm sewer system is modeled to determine the quantities of pollutants discharged during various storm conditions. Abatement alternatives and their respective costs are investigated for the reduction of pollutants from wet-weather sources, particularly combined sewer overflows. From the models it was determined that the impact of combined sewer overflows on dissolved oxygen concentrations in Onondaga Lake will not be critical after tertiary treatment for dry-weather waste water are placed in operation. Combined sewer overflow contributions of phosphorus will be negligible in comparison to those from other sources. In an average rainfall year, 38 violations of the fecal coliform standard will occur in the area of the lake intended for contact recreation. If abatement of pollution were to follow the 'general optimum solution' of this methodology, there would still be 13 annual violations. (Moore-SRC)

ENVIRONMENTAL EFFECTS OF WESTERN COAL SURFACE MINING, PART VI - SMALLMOUTH BASS AND LARGEMOUTH BASS IN THE TONGUE RIVER RESERVOIR, MONTANA, 1975-76,
Montana Cooperative Fishery Research Unit, Bozeman.
R. F. Penkal, and R. W. Gregory.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-194319, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-045, May, 2720. 54 p, 6 Fig, 14 Tab, 47 Ref. R803950.

Descriptors: *Fish populations, *Bass, *Coal mining, Strip mines, *Environmental effects, Reservoirs, Turbidity, Mortality, Growth, Water pollution sources, *Mine wastes.

Population parameters of smallmouth bass (Micropterus dolomieui) and largemouth bass (M. salmoides) were studied during 1975 and 1976, before expansion of surface coal mining adjacent to the Tongue River Reservoir in southeastern Montana. Reproductive success, as determined by alongshore seining, varied in different areas of the reservoir and may be correlated to turbidity. Population estimates were obtained at night during spring and fall 1976 with boat electrofishing gear. For yearling and older smallmouth bass the fall population of 13.0 fish/ha and the standing crop of 2.03 kg/ha represented 80 and 84% of the totals for basses in the reservoir. The largemouth bass population and standing crop during fall 1976 was 3.2 fish/ha and 0.32 kg/ha. The dominance by smallmouth bass of all year classes for both species except age-1, was attributed to a much higher mortality of underyearlings among largemouth bass. This higher mortality of largemouth bass may be correlated to a lack of shoreline vegetation in the reservoir. Summer mortality of age-2 and older smallmouth bass, estimated from the reduction in numbers of marked fish, was about 40%. Smallmouth bass growth and condition were better in the upper than lower end of the reservoir; the difference may be due to forage fish availability. Growth and length-weight relationships were above average for both species when compared with basses in other northern waters, indicating no noticeable effect from nearby surface coal mine operations at the time of the study. WASTE DISCHARGE REQUIREMENTS FOR NONSEWERABLE WASTE DISPOSAL TO LAND,
California State Water Resources Control Board, Sacramento.
A. L. Franks.
Report, July 1980. 93 p, Append.

Descriptors: *California, *Waste disposal, *Waste dumps, *Groundwater pollution, Landfills, Land disposal, Groundwater contamination, Leachates, Industrial wastes, Solid wastes, Farm wastes, Animal wastes, Sludge disposal, Infiltration.

This document, developed to describe portions of the California Administrative Code regarding waste disposal to land, indicates general guidelines and minimum standards for such disposal. However, due to specialized local conditions, Regional Boards may establish more stringent standards on a waste disposal operation or a site closure. The report contains a summary of relationships between solid wastes and water quality, the disposal site classification system, examples of waste discharge requirements, closure requirements, and a discussion of selected sections of the Code regarding waste disposal to land. There is also a discussion of the parameters that are considered in formulating waste discharge requirements, developing closure requirements, providing for financial responsibility for waste disposal sites, and the administration of the State Site Closure and Maintainance Revolving Account. Not included, but to be developed at a later date, are guidelines to determine the acceptability of a report on assurances that monies are available, in the amount estimated, as called for in Section 2557 of the Code. KELP BEDS AT SAUNDERS REEF, MENDOCINO COUNTY.
California State Water Resources Control Board, Sacramento.
California Marine Waters, Areas of Special Biological Significance, Reconnaissance Survey Report. Water Quality Monitoring Report No 80-3, September 1980. 42 p, 3 Fig, 5 Tab, 20 Ref.

Descriptors: *California, Marine resources, *Kelps, *Reefs, *Marine biology, Marine geology, *Coastal waters, Marine plants, Biological oceanography, Environmental protection, Wastewater outfall, On-site data collections, Saunders Reef, Mendocino County.

The kelp beds at Saunders Bay in northern California are designated by the California State Water Resources Control Board as an Area of Special Biological Significance (ASBS). It is a complex area bounded on the east by cliffs supporting a characteristic maritime bluff flora. To evaluate the status of protection of the marine resources of this ASBS, a reconnaissance survey was performed. The study concluded that (1) activity around and west of Highway 1 should be carefully planned to avoid increased erosion, view alteration and possible wastewater escape into the ASBS; (2) increased public access will impact the relatively pristine condition of the ASBS; (3) future impact studies should include long-term studies of the impacted communities with field experiments to test any effects of perturbations. Lack of access, rough sea conditions, and the presence of red abalone all suggest that the area has not been greatly affected thus far by man's activities; this may change with increased use by skin divers and greater coastal access. Some of the surrounding land is subdivided for home construction, and development could increase bluff erosion and restrict the view of the reef. The use of home septic tank systems has the potential of allowing polluted water into the ASBS. (Garrison-Omniplan)

SAN DIEGO MARINE LIFE REFUGE, SAN DIEGO COUNTY.
California State Water Resources Control Board, Sacramento.
California Marine Waters, Areas of Special Biological Significance, Reconnaissance Survey Report. Water Quality Monitoring Report No 80-5, September, 1980, 52 p, 1 Fig, 5 Tab, 24 Ref, 4 Append.

Descriptors: *California, Marine resources, *Marine biology, *Coastal waters, Marine geology, Marine plants, Biological oceanography, Environmental protection, Wastewater outfall, Wastewater pollution, Storm wastewater, On-site data collections, *San Diego Marine Life Refuge.

Areas of Special Biological Significance (ASBS) have been designated by the California State Water Resources Control Board in its effort to adopt water quality control plans for wastes discharged to ocean waters. To evaluate the protection status of marine resources at San Diego Marine Life Refuge, an ASBS, a reconnaissance survey was conducted that integrated all available hydrographic, geologic and biological information. Means of investigation included a search of records, map reconnaissance, shoreline and underwater observations, interviews, and a literature review. There appeared to be no actual point source pollution threats except that of sewage spills during periods of heavy rainfall. Sailing, shore fishing, snorkeling, SCUBA diving, surfing, body surfing, and tide-pooling are some of the water-use recreational activities that occur within the Refuge, which is adjacent to Scripps Institute of Oceanography in La Jolla. The study suggested periodic but regular monitoring of the ASBS to evaluate accurately the status of protection afforded the area. The study also urges consideration be given to extending the boundaries of the Refuge to include the head of Scripps Canyon. (Garrison-Omniplan)

JULIA PFEIFFER BURNS UNDERWATER PARK, MONTEREY COUNTY.
California State Water Resources Control Board, Sacramento.
California Marine Waters, Areas of Special Biological Significance, Reconnaissance Survey Report. Water Quality Monitoring Report No 80-4, September, 1980. 76 p, 11 Fig, 9 Tab, 33 Ref, 2 Append.

Descriptors: *California, Marine resources, *Marine biology, *Waste water outfall, Marine geology, *Marine fisheries, Submarine canyons, Submerged plants, Biological oceanography, Coastal waters, Environmental protection, Contamination, Waste water pollution, Storm waste water, On-site data collections, *Julia Pfeiffer Burns Underwater Park.

Diverse and abundant assemblages of sessile, filter-feeding invertebrates make the Julia Pfeiffer Burns Underwater Park one of the most beautiful locations on the California coast. This area was designated an Area of Special Biological Significance (ASBS) by the California State Water Resources Control Board in the adoption of water quality control plans for wastes discharged to ocean waters. Subtidal regions were surveyed using SCUBA to note topography, habitats, and macroorganisms; other data were collected using photography and landside observations. Because of the ASBS's poor access from land and sea, and its distance from Monterey, no threats to water quality were found. However, some impacts are possible in the future because nearby parks allow hiking and picnicking, and commercial fishing is allowed within the boundaries of the ASBS to a depth as shallow as 325 feet. Sportfishing is limited by the lack of accessibility. Although the ASBS is within Kelp Lease Area 214, no harvesting of giant kelp takes place. The ASBS is contained within the California State Sea Otter Reserve. There are many kinds of biota found in the underwater park that are listed in the report. For safety reasons, the study recommends that recreational diving not be permitted. (Garrison-Omniplan)

INTERACTIONS OF LIGHT AND NITROGEN SOURCE AMONG PLANKTONIC BLUE-GREEN ALGAE,
Alabama Univ., University. Dept. of Biology.
A. K. Ward, and R. G. Wetzel.
Archiv fur Hydrobiologie, Vol 90, No 1, p 1-25, September, 1980. 12 Fig, 4 Tab, 44 Ref.

Descriptors: *Plankton, *Cyanophyta, *Light penetration, *Nitrogen fixation, Eutrophication, Nutrients, Aquatic algae, Biomass, Aquatic life, Aquatic microorganisms.

Studies were conducted to describe the light regime, possible nitrogen sources and genera of blue-green algae associated with nitrogen-fixing, epilimnetic blue-green algae and non-nitrogen-fixing metalimnetic blue-green algae, to evaluate growth rates of representative isolates of blue-green algae on different nitrogen sources under light regimes similar to those found in natural populations, and to evaluate short-term responses to changes in light intensity in relation to photosynthetic rates and changes in carbon and nitrogen content with various nitrogen sources. Two different aquatic systems were studied, one the moderately productive Lawrence Lake and the other the hypereutrophic Wintergreen Lake. The findings suggested that the nitrogen source determined the lowest light intensity necessary to maintain growth in these aquatic systems. Most of the carbon and nitrogen fixation occurred within an array of light intensities ranging from very low to high, but significantly less than surface values. Based on saturation curves and lake profiles of nitrogen and carbon fixation in this study, the range of light intensities should result in a more balanced C:N ratio than continuous exposure to surface values or very low light intensities. Additionally it would provide sufficient photogenerated reductant and carbon reserve for maintenance of carbon and nitrogen fixation. Spatial optimization with regard to light and nitrogen source among planktonic blue-green algae is suggested by the findings of this study. (Baker-FRC)

THERMAL TOLERANCE OF THE ISOPOD LIRCEUS BRACHYURUS (CRUSTACEA:ISOPODA),
Tennessee Univ., Knoxville. Dept. of Zoology.
N. J. Cheper.
American Midland Naturalist, Vol 104, No 2, p 312-318, October, 1980. 1 Fig, 1 Tab, 18 Ref.

Descriptors: *Lirceus brachyurus, *Invertebrates, *Isopods, *Thermal stress, Thermal pollution, Aquatic life, Aquatic animals, Water pollution effects, Temperature, Water temperature, Heated water, Hydroelectric plants.

The temperature tolerance of a freshwater macroinvertebrate, the isopod Lirceus brachyurus (Crustacea:Isopoda) was investigated. Isopods were collected between August 1977 and July 1978 from a small tributary of Buffalo Creek in Anderson County, Tennessee. For each tolerance test, 12 animals were immediately exposed to the test temperature and 12 were gradually exposed to the test temperature. Animals were checked for mortality at 1/2, 1, 2, 4 and 8 hr after exposure had begun. Subsequent examinations were made every 8 hr for 2 wk. Only at the highest temperature, 35C, did the manner of exposure, gradual vs immediate, make a difference in the adaptability of the test animals. At this temperature, animals exposed gradually succumbed less rapidly. However, once this temperature was reached, there was no difference in rate of death. Animals acclimated at 25C showed high natural mortality rates (60%) during acclimation. The highest temperature tolerated by the species exceeded that to which the animal would be exposed under natural conditions, thus forming a safety margin. The results indicate that Lirceus brachyurus populations would be severely affected by hot water discharges, while cold water discharges during initiation of power plant output or after periods of plant shutdown would not affect isopod populations. MEASUREMENT OF PHYSIOLOGICAL CONDITION OF MUSSELS TRANSPLANTED ALONG A POLLUTION GRADIENT IN NARRAGANSETT BAY,
Environmental Research Lab., Narragansett, RI.
J. Widdows, D. K. Phelps, and W. Galloway.
Marine Environmental Research, Vol 4, No 3, p 181-194, 1980-1981. 2 Fig, 4 Tab, 34 Ref.

Descriptors: *Mussels, *Narragansett Bay, *Bioindicators, Animal physiology, *Water pollution effects, Pollutant identification, Organic compounds, Metals, Environmental effects, Sediments, Growth rates, Oil pollution, Oxygen requirements, Metabolism, Rhode Island.

Mussels transplanted to 4 sites along a pollution gradient in Narragansett Bay declined in performance and physiological condition from south to north, corresponding with increasing water pollution. Hydrocarbons in surface sediments increased from 0.11 mg per g at the relatively unpolluted southernmost site to 2.04 mg per g dry weight at the most polluted northern site. Metals (Cd, Cr, Cu, Ni, Pb, and Zn) showed a similar increase. Oxygen consumption at the stations did not vary significantly. Clearance rates declined from 5.21 liters per hour at the least polluted station to 2.54 liters per hour at the most polluted station in August, 5.91 liters per hour to 3.19 liters per hour in October. Ammonia excretion was highest at the most polluted site. The O:N ratio declined from 75

in the north to 29.6 in the south in August, but was not statistically different in October. An O:N ratio of 30 or less indicates a very stressed condition. Scope for growth declined from 35.64 Joules per hour (south) to 7.17 J per hour (north) in August and 28.90 (south) - 7.25 (north) J per hour in October. (Cassar-FRC)

Seattle, Washington, discharges its combined stormwater and sanitary wastes into an intertidal area of Puget Sound. During rain storms, capacities of the treatment plants are exceeded, releasing untreated domestic and industrial wastes into the marine environment. The effect of these pollutants on marine invertebrates was determined during a study conducted during April and May, 1977. Fauna close to and southwest of the outfall were most acutely affected. Opportunistic species, the polychaete Capitella capitata and the amphipod Aoroides columbiae, favored the most polluted sites, where zinc, copper, and lead were present in the sediment and volatile organic matter was plentiful. Burrowing deposit feeders were common. At sites further from the outflow, mollusks and crustaceans, especially the bivalve Axinopsida serricata, became more abundant. Surface feeding organisms also were more plentiful. Shallow subtidal areas (9 m below MLLW) appeared more affected by the pollution than deeper sites (13 and 24 m below MLLW). (Cassar-FRC)

SEDIMENT CHARACTERISTICS OF ELEOCHARIS ACICULARIS (L.) R. S. SITES IN STREAMS AND LAKES OF CENTRAL PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Botany.
G. C. Kroh, and R. D. Schein.
Journal of Environmental Quality, Vol 10, No 1, p 49-52, January-March, 1981. 1 Fig, 2 Tab, 20 Ref.

Descriptors: *Acid mine water, *Water pollution effects, *Rooted aquatic plants, Acid streams, Mine drainage, Mine wastes, Sediments, Nutrients, Absorption, Aquatic productivity, *Pennsylvania, Acidity, Phosphorus, Soil chemistry.

Many streams of Central Pennsylvania have been polluted by acid mine drainage from coal mining activities. These streams are clear, unproductive, and contain few plankton and no fish. In order to restore aquatic communities to these waters, the macrophyte Eleocharis acicularis (L.) R. and S. (slender spikerush) was examined for its ability to grow on stream sediments. Radioactively labeled phosphorus was absorbed by the roots of the slender spikerush and transported to the leaves. Analyses of sediments from 14 different locations where the plant was growing showed that these macrophytes were generalists which could survive a large variety of chemical parameters provided that the predominant sediment make up was a silt-clay. The plants were very acid tolerant and provided a structural niche for periphyton and invertebrate consumers. The slender spikerush was also able to stabilize and modify the alluvial sediment with its filamentous root system and was considered an important factor in the restoration of mine-acid polluted streams. THE EFFECT OF GLUCOSE ON THE PRODUCTIVITY OF SEAWATER: AN EXPERIMENTAL APPROACH USING CONTROLLED AQUATIC ECOSYSTEMS,
British Columbia Univ., Vancouver. Dept. of Oceanography.
T. R. Parsons, L. J. Albright, F. Whitney, C. S. Wong, and P. J. Le B. Williams.
Marine Environmental Research, Vol 4, No 3, p 229-242, 1980-1981. 9 Fig, 3 Tab, 19 Ref.

Descriptors: *Productivity, *Sea water, *Carbohydrates, Organic matter, Bacteria, Nutrients, Phytoplankton, Algae, Marine algae, Nitrates, *Glucose, Water pollution effects, Photosynthesis, *Ecosystems.

Glucose was added in small quantities (1 or 5 mg per liter) to 60-ton enclosed sea water columns to study the effect of organic loading in marine waters. Additions of glucose and nutrients were made every three or four days over a 28-day period to two enclosures, with only nutrients in the control. Glucose enrichment caused an increase in the heterotrophic bacterial biomass and a decrease in algal production. Nitrate was a limiting factor, bacteria succeeding in competition with the phytoplankton. Secondary and tertiary productivity in the two heterotrophic systems were higher than in the autotrophic control. (Cassar-FRC)

GROWTH RESPONSES OF YELLOW PERCH, PERCA FLAVESCENS (MITCHILL), TO LAKE ACIDIFICATION IN THE LA CLOCHE MOUNTAIN LAKES OF ONTARIO,
Toronto Univ. (Ontario). Dept. of Zoology.
P. M. Ryan, and H. H. Harvey.
Environmental Biology of Fishes, Vol 5, No 2, p 97-108, April, 1980. 6 Fig, 2 Tab, 32 Ref.

Descriptors: *Perch, *Lakes, *Acidic water, Bioindicators, Growth rates, Freshwater fish, Yellow perch, La Cloche Mountains, *Ontario, Fish reproduction, Fish populations, Stress, Water pollution effects, Hydrogen ion concentration, Size, Environmental effects.

The effects of acid waters on growth of yellow perch were studied from 1966 to 1974 in 38 lakes in the La Cloche Mountains of Ontario. Fish 1 to 3 years old grew more rapidly; fish 4 to 9 years old had reduced growth rates. The relationship of mean length at a given age to lake pH (which varied from 4.10 to 6.48) was best described by linear equations. The increased growth rates of 1 to 3 year fish can be attributed to increases in food supply caused by a decrease in competition from less tolerant species. The most acid lakes contained very few fish 0 to 2 years old. Older perch, 4 to 9, showed reduced growth rates, possibly from acid stress, which can cause severe osmotic disturbances. Fish respond to this by expending energy at the expense of growth. Food species are also fewer. The growth rate of yellow perch may be useful as an indicator of environmental stress. (Cassar-FRC)

CHANGES IN NITROGEN CYCLING AT AN OLD-GROWTH DOUGLAS-FIR SITE AFTER DISTURBANCE,
Oregon State Univ., Corvallis. Dept. of Forest Science.
P. Sollins, K. Cromack, Jr., F. M. McCorison, R. H. Waring, and R. D. Harr.
Journal of Environmental Quality, Vol 10, No 1, p 37-42, January-March, 1981. 3 Fig, 2 Tab, 40 Ref.

Descriptors: *Nitrate, *Soil water, *Water quality control, Nitrogen, Cycling nutrients, Herbicides, Nitrification, Soil water movement, Foliar, Forest management, Seasonal, Ammonia, Leaching, Coniferous forests, *Forest watersheds.

The exportation of dissolved N from terrestrial ecosystems through soil water can affect N availability for productivity as well as the processes in natural streams and water quality. The effects of disturbances on the N cycle were examined in a 450-year-old Douglas-fir stand on a 10.24-ha watershed of the H. J. Andrews Experimental Forest in Oregon. All vegetation was killed by herbicides while causing as little disturbance as possible to the leaf litter and soil. Foliage samples collected in July and August of 1974 were analyzed for N, lignin, and cellulose. The concentration of nitrogen in falling foliage and the soil moisture were greater on the herbicide treated plot than in the control area. Soil solution levels of nitrate and Kjeldahl N were higher on the treated than on the untreated sites at depths greater than or equal to 1 meter or at the bottom of the rooting zone. On the undisturbed plots, nitrate was found in solution at significant levels only at a depth of 2 meters. These findings suggest that studies on the impact of forest management practices or other disturbances on N budgets and water quality should consider measurements of total N transfers, and not only transfers of nitrate N. COAL-LIQUEFACTION PRODUCTS, SHALE OIL, AND PETROLEUM. ACUTE TOXICITY TO FRESHWATER ALGAE,
Oak Ridge National Lab., TN. Environmental Sciences Div.
J. M. Giddings, and J. N. Washington.
Environmental Science and Technology, Vol 15, No 1, p 106-108, January, 1981. 2 Tab, 31 Ref.

Descriptors: *Oil pollution, *Water pollution effects, *Algae, Fuels, Toxicity, Synthetic fuels, Oil spills, Aquatic life, Aquatic algae, Aquatic plants, Coal liquefaction industry, Shale oil industry, Cyanophyta.

Freshwater algae, Selenastrum capricornutum (a green alga) and Microcystis aeruginosa (a blue-green alga), showed acute toxic effects from exposure to water soluble fractions (WSF) of oils in the following order: coal liquefaction products>shale oil products>petroleum products. WSF's were tested in concentrations of 0.1, 1, 10, and 100%. Most of the 11 coal liquefaction products were toxic at 1% and greater; 4 at 0.1%. Three unrefined shale oils inhibited photosynthesis at 10% and greater and were variably toxic at 1% and less. Two refined shale oils and the 5 petroleum products (DFM, No 2 diesel oil, and three No 6 fuel oils) showed little toxicity at all concentrations with the exception of some at 100% WSF. All samples were tested for absorbance at 254 nm, the absorption maximum for benzene and an approximation of aromatic content. The products with higher absorbances tended to be the most toxic to algae. (Cassar-FRC)

THE INADEQUACY OF EXISTING CHLOROPHYLL-A/PHOSPHORUS CONCENTRATION CORRELATIONS FOR ASSESSING REMEDIAL MEASURES FOR HYPERTROPHIC LAKES,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
R. J. Allan.
Environmental Pollution (Series B), Vol 1, No 3, p 217-231, 1980. 10 Fig, 2 Tab, 25 Ref.

Descriptors: *Eutrophication, *Lakes, *Chlorophyll, Trophic levels, Measurement, Photosynthesis, Phytoplankton, Aquatic life, Aquatic plants, *Canada.

Since 1970 a sporadic data base concerned with nutrient and chlorophyll-a concentrations in the Fishing Lakes and Crooked and Round Lakes has been gathering information under the guidance of the Water Pollution Control Branch, Environment Canada. A systematic bi-weekly survey of nutrient and chlorophyll-a concentrations was conducted in these same lakes between June 1977 and June 1978. During 1978 and 1979 weekly sampling of Rock Lake for nutrients and chlorophyll-a concentrations was carried out during the open water period. The data collected indicate that inaccuracies exist in prediction of lake phosphorus concentrations from phosphorus loading models and mean and maximum chlorophyll-a from lake phosphorus concentrations. The data also indicate that representative sampling to estimate true phosphorus

loading and true mean and maximum chlorophyll-a concentrations is not able to provide reliable information. Remedial measures may be taken to reduce external phosphorus loads, thus resulting in the reduction of long-term mean and maximum open-water summer chlorophyll-a concentrations. However, perturbations in phytoplankton biomass will still remain at such a level that short-term algal blooms or scums on any particular day may still be sufficiently intense for long-term improvements not to be deemed significant to the occasional recreational user of the water body. (Baker-FRC)

AFFINITY TESTS FOR THE DETECTION OF COMMUNITY ALTERATION IN PLANKTON: EVALUATION WITH A DISTRIBUTIONAL COMPUTER MODEL,
Georgia Univ., Athens. Dept. of Geology.
W. B. Hayes.
Environmental Pollution (Series B), Vol 1, No 2, p 127-148, 1980. 5 Fig, 8 Tab, 17 Ref.

Descriptors: *Phytoplankton, *Biological communities, *Computer models, Thermal stress, Model studies, Analytical techniques, Plankton, Fager test, Orloci test, Affinity testing, Sampling, Ecological distribution, Stochastic processes, Statistical methods, Temperature effects, Water pollution effects, Pollutant identification.

The Fager recurrent group analysis was found superior to the Orloci n-dimensional clustering procedure in environmental monitoring of a complex plankton community undergoing thermal stress. Although both affinity tests performed equally well in a model community study, the Fager method gave better results where repetitive samples were taken during a control-to-outfall transect, commonly employed in field studies. A spatial distribution model of species within the phytoplankton community was constructed by computer with built-in stochastic temporal community variations. The use of affinity tests can detect small changes in species variation, since all species are considered, not only indicator organisms. (Cassar-FRC)

ALGAL RESPONSE TO COPPER UNDER RIVERINE CONDITIONS,
State Univ. of New York Coll. at Buffalo. Dept. of Biology.
R. L. Klotz.
Environmental Pollution (Series A), Vol 24, No 1, p 1-19, January, 1981. 3 Fig, 12 Tab, 29 Ref.

Descriptors: *Algae, *Rivers, *Industrial wastes, *Copper, *Toxicity, Effluents, Chlorella, Scendesmus, Chlamydomonas, Water pollution sources, On-site data collection, Heavy metals, Metals, Absorption, Aquatic algae, Water pollution effects, Furnace Brook, *Connecticut.

Algae (Chlamydomonas sp., Scenedesmus sp., and Chlorella sp.) were grown in dialysis chambers immersed in Furnace Brook, Connecticut, for periods of a week throughout the year to determine the effects of a copper-containing effluent discharged from an upstream factory. Growth rates were highest in summer in spite of the highest Cu levels (135-687 micrograms per liter) and were correlated with temperature but not with dissolved Cu concentration of the water. Final Cu concentration in the cells ranged from 0 to 22.0 mg per g dry weight. Cu uptake rates were highest at optimal temperatures, which varied with species and Cu concentration. Algae in this river were tolerant of copper. (Cassar-FRC)

THE EFFECT OF A FLUORIDE EFFLUENT ON MARINE ORGANISMS,
Otago Univ., Portobello (New Zealand). Marine Lab.
N. W. Pankhurst, C. R. Boyden, and J. B. Wilson.
Environmental Pollution (Series A), Vol 23, No 4, p 299-312, December, 1980. 1 Fig, 6 Tab, 20 Ref.

Descriptors: *Marine organisms, *Toxicity, *Fluoides, Water pollution effects, *Industrial wastes, Effluents, Water pollution sources, Discharge(Water), Waste water disposal, Fertilizers, Mussels, Aquatic animals, Fish, Sole, Anemone, Cockle, Brine shrimp, Invertebrates, Shellfish, Fertilizer plant, *New Zealand.

Fluoride-containing effluent from a New Zealand fertilizer plant affected the distribution and abundance of marine organisms near the outfall. Encrusting fauna were counted in February and March 1978 at 18 stations 1 to 400 meters north of the outfall and at 2 stations 400 and 450 meters south of the outfall. Immediately adjacent to the outfall, no encrusting fauna were present. At 50 meters or less, relatively large numbers of bryozoans, ascidians, and bivalves were seen. Numbers increased toward the outer stations, with sponges, ascidians, and anemones appearing at a distance of 400 meters. Here only 1% of the rock examined was uncolonized. Additional counts in November-December 1978 and January 1979 showed similar patterns. Fluoride concentrations were high (10 ppm) in surface samples up to 10 meters from the outfall and dropped rapidly with distance to background levels. Sublethal toxicity tests on the brine shrimp, Artemia salina, showed adverse growth effects at all concentrations of fluoride, 5, 10, 15, and 20 ppm. After 12 days the controls reached a mean body length of 1.740 mm; those exposed to the highest fluoride concentration, 20 ppm, averaged 1.300 mm. Acute toxicity tests on 5 species revealed little mortality from 10 and 25 ppm F effluent or NaF solution, some mortality at 50 and 100 ppm NaF solution, and considerable mortality in all species at 50 and 100 ppm F effluent. (Cassar-FRC)

THE CHRONIC TOXICITY TO DAPHNIA MAGNA OF ACRIDINE, A REPRESENTATIVE AZAARENE PRESENT IN SYNTHETIC FOSSIL FUEL PRODUCTS AND WASTE WATERS,
Oak Ridge National Lab., TN. Environmental Sciences Div.
B. R. Parkhurst, A. S. Bradshaw, J. L. Forte, and G. P. Wright.
Environmental Pollution (Series A), Vol 24, No 1, p 21-30, January, 1981. 6 Fig, 2 Tab, 12 Ref.

Descriptors: *Toxicity, *Daphnia, *Organic compounds, *Fuel, Synthetic fuels, Aquatic life, Invertebrates, Crustaceans, Acridine, Organic wastes, Water pollution sources, Water pollution effects, Azaarenes, Waste water, Reproduction, Pesticides.

The toxicity of acridine, an organic base present in synthetic fuel waste waters, was determined using first instar Daphnia magna. The 48 hour LC50 was 2.3 + or - 0.4 mg per liter. Chronic toxicity was judged by survival, occurrence of the primiparous instar, age at onset of reproduction, number of broods per female, number of young per brood, and total number of young per female. The estimated no-observed-effect concentration was 0.4 mg per liter; the lowest-observed-effect concentration 0.8 mg per liter. The least sensitive criterion was the occurrence of the primiparous instar; the most sensitive involved numbers of young and broods. Acridine was more toxic to Daphnia magna than most of the materials listed in a table of toxicities of organic acids, organic bases, and polyaromatic hydrocarbons found in sythetic fuel waste waters. However, its toxicity is less than that of the chlorinated hydrocarbon pesticides. (Cassar-FRC)

Environmental Pollution (Series B), Vol 2, No 2, p 145-161, 1981. 6 Fig, 2 Tab, 43 Ref.

Descriptors: *Paper pulp wastes, *Graphical analysis, Analytical techniques, Industrial wastes, Saw mills, Pulp and paper industry, Bleaching wastes, Water pollution sources, Phenols, Lakes, Canada, *Environmental effects.

A new approach based on graphs of coherence was evaluated for predicting the effect of a kraft pulp mill on water quality. Graphs of coherence were constructed to permit the systematic identification of the relationships between the mill and various components of the environment. A forestry complex consisting of a sawmill and kraft bleached pulp mill was established on the Chamouchouane River which flows into Lake St. John (Quebec, Canada). The graphs of coherence technique was applied to study the effects of the complex on lake species Salmo salar ouananiche. First, potential environmental impacts were determined, and second, the graph demonstrating the relationships between these impacts was constructed. This technique permits the rapid identification of serious environmental effects including avoidance effect, the presence of phenols, contact time, etc. (Small-FRC)

SOME ECOLOGICAL OBSERVATIONS ON ENVIRONMENTAL PARAMETERS, PLANKTONIC SEASONAL SUCCESSION AND BIOMASS IN RIO CRUCES (PROV. VALDIVIA), SOUTH CHILE,
Giessen Univ. (Germany, F.R.). Inst. fuer Pflanzenoekologie.
M. Durrschmidt.
Archiv fur Hydrobiologie, Vol 88, No 3, p 345-363, April, 1980. 9 Fig, 59 Ref.

Descriptors: *Phytoplankton, *Seasonal, *Algae, *Cruces River, *Chile, Diatoms, Biomass, Plankton, Fluctuations, Aquatic plants, Ecology, Rivers, Brackish water, Estuaries, Valdivia River, Chlorophyll, Chlorophyta.

Phytoplankton were observed monthly from May 1975 to April 1976 in the Cruces River, Chile, an area relatively uninfluenced by man's activities. The paper defines the composition, relative abundance and seasonal distribution of the algae to provide base information for future limnological investigations. A tremendous earthquake in May 1980 caused inundation of the last 35 km of the river. A total of 382 algal taxa were counted: Chlorophyta, 249; Bacillariophyceae, 76; Cyanophyta, 29; Chrysophyceae, 13; Euglenophyta, 14; and Xanthophyceae, 1. Chrysophyceae and diatoms increased rapidly in winter (June-Aug.). Spring saw a sharp decline in Chrysophyceae and a great increase in green algae, especially desmids. Diatoms and green algae again increased in summer (Nov.-Dec.). During Jan.-April (autumn) brackish water entered and algae species and numbers were reduced. Total algal cells reached a peak in June and in Nov./Dec. and a minimum in Sept. The algal flora was rich in species and poor in individuals. (Cassar-FRC)

PRIMARY PRODUCTION OF PHYTOPLANKTON AND ENVIRONMENTAL CHARACTERISTICS OF A SHALLOW QUATERNARY LAKE AT EASTERN BRAZIL,

Universidade Federal de Minas Geris, Belo Horizonte (Brazil). Dept. of General Biology.
F. A. R. Barbosa, and J. G. Tundisi.
Archiv fur Hydrobiologie, Vol 90, No 2, p 139-161, October, 1980. 9 Fig, 6 Tab, 51 Ref.

Descriptors: *Phytoplankton, *Distribution patterns, *Lakes, Nutrient requirements, *Brazil, Lake Carioca, Temperature, Light, Nutrients, Plankton, Aquatic life, Aquatic plants, Aquatic microorganisms.

Research was conducted at Carioca Lake, Eastern Brazil, concerning studies of the standing stock and primary production of phytoplankton and critical environmental factors which may control or limit it. The lake system studied is at an elevation of about 300 meters in a physiographic area known as the Interplanaltic Depression of River Doce. The air temperature averages from 20 to 22C. A rainy and a dry season can be distinguished, with an average yearly rainfall of 1500 mm. The lakes are situated in a tropical rain forest. Five lakes were chosen for a comparative limnological study. Higher levels of primary production were noted in winter, and diurnal cycles of certain environmental factors such as temperature appear to affect the population activities. A deoxygenated layer is marked off by the thermal discontinuity during the period of strong stratification. Vertical profiles of photsynthesis exhibit light inhibition at the surface. Primary production values ranged from 0.32 mg C/cubic meter to 108.8 mg C/cubic meter per day. In the summer the dark fixation values were high, ranging from undetectable up to 90%. Low photosynthetic efficiencies were recorded. It appeared that the factors affecting seasonal variations were mainly concerned with nutrient supply rather than light and temperature variations. The absence of a thermocline in the winter was probably responsible for higher levels of production due to nutrient enrichment of the euphotic zone by mixing. (Baker-FRC)

TEMPORAL PATTERNS IN RECOLONIZATION OF STREAM BENTHOS,
Scarborough Coll., Toronto (Ontario). Div. of Life Sciences.
D. D. Williams.
Archiv fur Hydrobiologie, Vol 90, No 1, p 56-74, September, 1980. 11 Fig, 37 Ref.

Descriptors: *Benthos, *Streams, *Temporal distribution, Aquatic life, Aquatic microorganisms, Biota, Benthic environment, Environmental effects, Seasonal distribution.

Recolonization by stream benthos was studied over a period of a year in efforts to detect patterns of movement resulting from interactions of both biotic and abiotic influences so as to provide information on the temporal nature of benthic communities. The study was made in a 15 m long riffle on the upper east branch of Duffin Creek, Durham County, Ontario. The depth varied between 20 cm in midsummer and 60 cm during the spring runoff. During the winter months relatively low numbers of individuals and species colonized the stream when compared to summer months. It is suggested that water temperature was the significant factor in this difference. A negative correlation was found between numbers of animals colonizing the stream each month and water depth. No correlation was noted with amounts of either fine particulate organic matter or coarse particulate organic matter, as it settled in the substrates. Some evidence was found of seasonal mobility that probably was associated with a specific stage in the life cycle of individual species. It is suggested that caution be applied in stream studies where artificial substrate techniques are used to collect information concerning species composition and the effects of pollutants. PHOSPHORUS, CHLOROPHYLL, AND EUTROPHIC LAKES,
Alberta Univ., Edmonton. Dept. of Botany.
M. Hickman.
Archiv fur Hydrobiologie, Vol 88, No 2, p 137-145, March, 1980. 2 Fig, 2 Tab, 28 Ref.

Descriptors: *Phosphorus compounds, *Chlorophyll, *Eutrophication, *Eutrophic lakes, Standing crops, Phytoplankton, Lakes, Alberta, Canada, Oligotrophy, Model studies, Regression analysis, Trophic level, Nutrients.

The curvilinear regression equation, log chlorophyll a concentration = 3.27 log (log phosphorus concentration) + 0.542, was developed to predict summer phytoplankton standing crop size from measurements of total phosphorus concentration at spring overturn. This model applies to a wide range of lakes, from oligotrophic to eutrophic. The data used to derive the equation were collected from 12 eutrophic lakes in Alberta, Canada. However, in extremely eutrophic lakes with large standing crops, the physical factors of temperature, irradiance, and turbulence become increasingly important. (Cassar-FRC)

THE DISTRIBUTION OF THE POLYCHAETE CAPITELLA CAPITATA (FABRICIUS) IN DOCK SEDIMENTS,
Liverpool Polytechnic (England). Dept. of Biology.
C. J. James, and R. Gibson.
Estuarine and Coastal Marine Science, Vol 10, No 6, p 671-683, June, 1980. 4 Fig, 5 Tab, 38 Ref.

Descriptors: *Heavy metals, *Polychaetes, *Bioindicators, *Sediments, Benthic fauna, Capitella capitata, Invertebrates, Worms, Annelids, Water pollution effects, Docks, Metals, Copper, Zinc, Iron, Lead, Organic matter, Hydrogen sulfide, Sulfides, Mersey River, *Liverpool, England, Aquatic life.

The polychaete Capitella capitata appeared unaffected by heavy metal accumulations (all in parts per million: Cu 23.7, Fe 16, 368, Pb 327.8, and Zn 1089.6) in sediments of an enclosed non-tidal dock at Liverpool, England. Water in this area was subject to contamination by untreated sewage from a night club and spillage from gravel, sand, and molasses loading. A total of 1204 specimens from 13 species of invertebrates (Annelida and Arthropoda) were collected in the dock area. Species diversity was low, and Capitella accounted for 88.5% of the total animals. Polychaeta as a group were 95.5% of all fauna collected. Capitella was more prevalent in coarse sandy sediments (subject to mechanical instability, low levels of organic matter and high levels of heavy metals) than in the silt (stable, low oxygen, high organic matter and sulfides). (Cassar-FRC)
W81-02887

EVIDENCE FOR THE INCREASED EUTROPHICATION OF LAKE NAINITAL AS A RESULT OF HUMAN INTERFERENCE,
Kumaun Univ., Naini Tal (India). Dept. of Zoology.
M. C. Pant, A. P. Sharma, and P. C. Sharma.
Environmental Pollution (Series B), Vol 1, No 2, p 149-161, 1980. 4 Fig, 3 Tab, 43 Ref.

Descriptors: *Eutrophication, *Lakes, *Ecology, *Lake Nainital(India), Aquatic life, Water pollution effects, Nitrates, Nitrogen compounds, Phosphates, Phosphorus compounds, Environmental effects, Algae, Zooplankton, Invertebrates, Dissolved oxygen, Bioindicators, India.

The rapid eutrophication of Lake Nainital, India, was documented by measuring water quality parameters during September 1977-August 1978 and comparing results with historical data and indicators of eutrophication. Current observations, with 1954 data, if available, in parentheses, are as follows: Secchi transparency, 75-194 cm; dissolved oxygen in surface waters, 5.65-17.2 mg per liter; pH, 7.0-9.6; alkalinity, 110-520 ppm; total hardness, 400 ppm (300 ppm); ammonia N, 33-422 micrograms per liter (19.0); nitrate-N, 62.5-750 micrograms per liter (traces in 1954); and phosphate, 6.5-70 micrograms per liter. Biological indicators of eutrophication include the presence of Tubifex spp., Chironomus spp., Microcystis sp., and zooplankton common in eutrophied lakes. Bottom fauna are completely absent, as is the dinoflagellate Ceratium hirundinella. Both physico-chemical and biological criteria indicate that this lake is undergoing rapid eutrophication. (Cassar-FRC)

NON-RADIOLOGICAL ENVIRONMENTAL IMPLICATIONS OF NUCLEAR ENERGY,
Biswas and Associates, Oxford (England).
A. K. Biswas.
Environmental Conservation, Vol 7, No 3, p 229-237, Autumn, 1980. 1 Fig, 1 Tab, 48 Ref.

Descriptors: *Thermal water, *Powerplants, *Thermal pollution, *Nuclear powerplants, Temperature effects, Environmental effects, Aquatic life, Foreign projects, Ecosystems.

Thermal pollution caused by nuclear energy power plants may affect water-based ecosystems. Most experimental studies do not indicate major impacts such as massive fish kills, but the combined effects of pollutants and heat could be serious. Chemicals used to control corrosion, neutralize pH, or control biological fouling are often discharged into the water. Heat may also affect organisms' response to irradiation. Studies have shown that radiation damage is greater in animal cells also exposed to heat. There is some data on the possible benefits of thermal discharges. Possible uses are aquaculture and agriculture, space heating, industrial uses, and irrigation use. Increases in water temperature have been found to increase growth rates of shrimp, catfish, oysters, and other creatures. Heated irrigation water can prolong the growing season and prevent damage by early or late frosts. Land use impacts are also discussed. (Small-FRC)

USE OF SYNTHETIC DETERGENTS IN MALAYSIA,
Malaya Univ., Kuala Lumpur (Malaysia).
M. A. Quddus.
Environmental Conservation, Vol 7, No 4, p 287-288, Winter, 1980. 2 Ref.

Descriptors: *Detergents, *Malaysia, *Eutrophication, Phosphates, Lakes, Water pollution sources, Phosphorus compounds, Foreign countries, Water pollution control, *Water pollution effects.

Rising use of synthetic phosphate-containing detergents in Malaysia has been responsible for eutrophication of Taman Jaya, a lake in the suburban area of Kuala Lumpur. Although no eutrophication studies have defined the state of Malaysia's waters, it is believed that phosphates from laundry water, untreated sewage, industry, and agriculture are producing an enormous phosphate load. It is recommended that in developing countries phosphates be banned or their percentage lowered in detergents, since even primary sewage treatment facilities are minimal. (Cassar-FRC)

5D. Waste Treatment Processes

PROCESS FOR REMOVAL OF DISCRETE PARTICULATES AND SOLUTES FROM LIQUIDS BY FOAM FLOTATION,
J. H. Hoge, and J. H. Hubbard.
U.S. Patent No 4,203,837, 15 p, 13 Fig, 11 Ref; Official Gazette of the United States Patent Office, Vol 994, No 3, p 985, May 20, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Foam separation, Surfactants, Bubbles, Floating, Absorption, Pregenerated foam.

A process removes discrete particulates from liquids by foam flotation which is readily adaptable to continuous or batch processing. A continuous stream of foam, in which the gaseous medium is subdivided into individual bubbles, each encapsulated in a film consisting of a foaming agent solution, each film being shared with each adjacent gas cell, is pregenerated. The composition of the films of the pregenerated foam may include, in addition

to the foaming agent, other agents or reagents useful or necessary for the collection and removal of the solid or solute material being extracted by counter ion action. The pregenerated foam is then introduced at a predetermined rate into the liquid carrying the solids or solutes and is dispersed. The preformed surfactant films of the bubbles contact and attach the solid particles by counter ion action from the liquid during the progress of the foam bubbles through the liquid. The loaded foam bubbles are allowed to float to the surface where they consolidate into a stable foam layer for convenient removal. Dissolved materials in the liquid body are similarly extracted by use of film having composition suitable for ionic adsorption or reagents for precipitation of the soluble material on or within the film. Available from the National Technical Information Service, Springfield, VA 22161 as PB81-197600, Price codes: A05 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT/RU-80/3, September, 1980. 81 p, 25 Fig, 33 Tab, 15 Ref. OWRT-C-80274-R(No 8804)(1), 14-34-0001-8804.

Descriptors: *Water reuse, Waste water renovation, *Membrane processes, *Reverse osmosis, Ultrafiltration, Waste water treatment, Oil wastes.

Colloidal and dissolved organic matter was shown to be a primary foulant in reverse osmosis treatment of wastewaters for reuse. A two-phase study was conducted on pretreatment methods to remove these organic foulants. In the first phase, river water and petroleum refinery effluent were treated with inorganic coagulants (ferric chloride and alum) under a variety of conditions. The clarified waters were then tested for fouling potential in reverse osmosis, at high membrane fluxes (25 to 35gfd) to accentuate fouling rates. Fouling flux decline was nearly always encountered; also, organic removal was ineffective. In Phase II, a novel set of thin film composite ultrafiltration membranes were developed. These consisted of anionic methyl cellulose graft copolymers deposited as membranes on microporous supports. These membranes removed organic foulants from river water and petroleum refinery effluent, and were fairly effective on municipal secondary effluent in ultrafiltrations at 50 psi.

USE OF CALCIUM STRIPPING COLUMN TO ACHIEVE ENERGY CONSERVATION AND RESIDUE REUSE IN PHOSPHATE PRECIPITATION BY LIME,
Missouri Univ.-Rolla. Dept. of Civil Engineering.
J-C. Huang, Y. A. Sun, and C. S. Liu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-197634, Price codes: A04 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri, Completion Report, November, 1980. 47 p, 12 Fig, 11 Tab, 6 Ref. OWRT-A-109-MO(1), 14-34-0001-9027 & 0127.

Descriptors: Calcium carbonate, *Chemical precipitation, Fluidized beds, *Hydroxylapatite, Lime, *Phosphorus removal, *Water pollution control, *Waste treatment.

This study was undertaken to evaluate the feasibility of using a fluidized sand bed to coprecipitate the insoluble phosphorus complex of hydroxylapatite with calcium carbonate on the surface of sand grains to form dry chemical pebbles. It was found that the operation of such a new technique was simple and it required a contact time of only 5 min. At pH 10.0, the concentration of P in raw sewage was reduced from 8 mg/L to about 3 mg/L. Also, about 50 to 70% of calcium carbonate was able to plate out on the surface of sand grains. If the influent was allowed to settle for 1 hr, the residual P was further reduced to 1 mg/L, and most of the remaining suspended solids could settle out effectively.

THE EFFECT OF HEAVY METALS ON THE PERFORMANCE OF ROTATING BIOLOGICAL CONTACTORS (RBC),
Oklahoma State Univ., Stillwater.
F. G. Dehkordi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198434, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, July, 1980. 51 p, 21 Fig, 9 Tab, 31 Ref. OWRT-A-087-OKLA(3).

Descriptors: *Biological waste water treatment, *Waste water facilities, *Water quality control, *Heavy metals, *Chemical oxygen demand, Waste water, Sewage, Waste water purification, Waste water treatment, Biological treatment, Sludge seeding, Biodegradation, Treated water, Water treatment, Research priorities, Evaluation, Chromium, Copper, Trace metals, Water pollution control.

Addition of hexavalent chromium (Cr) in the form of potassium chromate at concentrations of 1, 2, and 3 milligrams/liter (mgpl) did not decrease chemical oxygen demand (COD) removal efficiency of the rotating biological contactors (RBC) employed, but Cr at 20 mgpl did. When the RBC recieved wastewater containing potassium dichromate it removed 65-80% metal at concentrations of 1,2,3, and 20 mgpl. Hexavalent Cr (as the chromate salt) at 1-4 mgpl did not affect COD removal efficiency of the RBC. Removal efficiency of the chromate salt by the RBC was almost 100% at 1-2 mgpl, but only 68 and 62% of the Cr was removed at 3 and 4 mgpl, respectively. When hexavalent Cr was fed to the RBC in both salt forms, microbial growth was stimulated on the rotating discs relative to control conditions. RBC receiving waste waters containing copper (cupric sulfate) had higher COD removal efficiency at hydraulic loadings of 0.7 and 3 gallons/day/square-foot relative to the control, with copper removal considerably higher at the latter hydraulic loading. HOOVER DAM ADVANCED WASTE TREATMENT SYSTEM; VOLUME I, PILOT STUDIES REPORT.
Montgomery (James M.), Inc., Pasadena, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-180309, Price codes: A12 in paper copy, A01 in microfiche. Water and Power Resources Service, Boulder City, Nevada, Report, January, 1981. 257 p, 52 Fig, 79 Tab, 4 Append. 9-07-30-V0471.

Descriptors: *Waste water treatment, *Advanced waste water treatment, *Reverse osmosis, *Recreation wastes, Coagulation, Flocculation, Biological waste water treatment, Sedimentation, Filtration, Effluent limitations, Fouling, Hoover Dam, Pilot plants.

The advanced waste treatment plant at Hoover Dam is a facility capable of producing a high quality effluent. Included among the unit processes are a conventional activated sludge process, lime clarification, dual media filtration, cartridge filtration, and reverse osmosis. The objectives of the study were: to operate the treatment plant to produce an effluent of sufficient quality to satisfy stringent effluent discharge requirements; and to conduct performance tests of the reverse osmosis unit. The waste water can be classified as a dilute sanitary waste with extreme diurnal flow variations, typical of a facility which would be visited by a large number of tourists. Six treatment trains were evaluated in a bench-scale test program, and based on this data, two treatment trains were analyzed in full-scale tests. Treatment train No. 1 comprised secondary biological treatment; lime coagulation, flocculation and sedimentation; dual media pressure filtration, cartridge filtration; and reverse osmosis. Treatment train No. 2 comprised lime coagulation, flocculation and sedimentation of raw sewage; dual media pressure filtration; cartridge filtration; and reverse osmosis. Both treatment trains were capable of meeting the proposed stringent effluent discharge requirements. Uncontrolled biological growth in the reverse osmosis system presented problems in both treatment trains. Thin film composite polyamide membranes performed better than cellulose acetate membranes in the reverse osmosis unit as part of the second phase operation of treatment train No. 1. (Moore-SRC)

HOOVER DAM ADVANCED WASTE TREATMENT SYSTEM: VOLUME II, PILOT STUDIES SUMMARY DATA.
Montgomery (James M.), Inc., Pasadena, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-180317, Price codes: A13 in paper copy, A01 in microfiche. Water and Power Resources Service, Boulder City, Nevada, Report, January, 1981. 222 p, 14 Tab. 9-07-30-V0471.

Descriptors: *Advanced waste water treatment, *Waste water treatment, *Reverse osmosis, Recreation wastes, Filtration, Coagulation, Sedimentation, Flocculation, Biological waste water treatment, Turbidity, Particulate matter, Fouling, Hoover Dam, Pilot plants.

The objectives of this study were to operate the Hoover Dam Advanced Waste Treatment plant to produce an effluent of suffient quality to satisfy stringent effluent discharge requirements and to conduct performance tests of the reverse osmosis unit. This volume of the report provides tables of summarized data collected during full scale plant operation. Treatment train No. 1 comprised secondary biological treatment; lime coagulation, flocculation and sedimentation; dual media pressure filtration; cartridge filtration; and reverse osmosis. Treatment train No. 2 comprised lime coagulation, flocculation and sedimentation of raw sewage; dual media pressure filtration; cartridge filtration; and reverse osmosis. The data are presented in three sections corresponding to the chronological order in which the project was conducted. Section I contains information from the operation of treatment train No. 2 with cellulose acetate membranes in the reverse osmosis unit. Section II contains data from the operation of treatment train No. 1 with cellulose acetate membranes in the reverse osmosis unit. Section III contains information from the operation of both treatment trains with a combination of cellulose acetate and thin film composite polyamide membranes in the reverse osmosis unit. Data on turbidity, particle count, plugging index, unit process performance, and system performance are included. (Moore-SRC)

LABORATORY AND FIELD EVALUATION OF NS-100 REVERSE OSMOSIS MEMBRANE,
Abcor Inc., Wilmington, MA. Walden Div.
K. J. McNulty, D. C. Grant, J. R. Harland, and R. L. Goldsmith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-186026, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-059, April, 1980. 35 p, 11 Fig, 1 Tab, 6 Ref. R803753.

Descriptors: *Reverse osmosis, *Semipermeable membranes, *Metal-finishing wastes, *Zinc cya-

nide, Alkalinity, Deterioration, Waste water treatment, Water pollution control, Field tests, Evaluation, Membranes.

In an attempt to extend the applicability of reverse osmosis (RO) to the high-pH cyanide rinsewaters, laboratory life tests were conducted with B-9 and NS-100 RO membranes treating zinc cyanide plating solution at 10% of bath strength. The B-9 membrane was degraded by the high pH of the solution which was beyond the upper pH limit (pH 11) recommended for this membrane. The NS-100 membrane showed little deterioration in performance over the first 500 h of operation. A reduction in permeate flux and rejection after 500 h appeared to be due to precipitation of salts which resulted from operation in the closed loop test system and would not be expected in actual field operation. Field tests were conducted at New England Plating Company treating rinsewater from the zinc cyanide plating operation with a module of seven tubular NS-100 RO membranes. Conductivity rejections of 80-96% and zinc rejections of 96-99.7% were measured at flux levels of 0.20-0.37 cu m/sq m/day (5-9 gal/sq ft/day). During 2300 h of exposure to the rinsewater, the membrane showed no degradation in performance as determined by NaCl performance tests and standard tests with a solution of zinc cyanide plating bath diluted to 5% of bath strength. A number of attempts were made to fabricate an NS-100 spiral-wound module, but all were unsuccessful. Further development will be required before the NS-100 can be commercially offered in an economically attractive configuration. (Brambley-SRC)

OVERLAND FLOW: REMOVAL OF TOXIC VOLATILE ORGANICS,
Cold Regions Research and Engineering Lab., Hanover, NH.
T. F. Jenkins, D. C. Leggett, C. J. Martel, and H. E. Hare.
Army Corps of Engineers Special Report 81-1, February, 1981. 19 p, 6 Fig, 10 Tab, 33 Ref, 1 Append.

Descriptors: *Overland flow, *Chlorinated hydrocarbons, *Waste water treatment, Municipal waste water, Volatility, Chlorination, Disinfection, Mathematical models, Kinetics.

Chlorine disinfection of water and wastewater produces a number of volatile organics of which haloforms are the volatile organochlorine compounds produced in highest concentration. A small-scale overland flow system was studied to determine its effectiveness in reducing the levels of volatile trace organics in municipal waste water. The prototype system is 30.5 m in length by 8.8 m wide, and was subdivided into three parallel test sections. Waste water was applied at five different rates ranging from 0.40 to 1.32 cm/hr. The period of application was generally seven hours a day, five days per week. Chlorinated primary waste water, water collected from the surface at various points downslope, and runoff were analyzed by gas chromatography/mass spectrometry using a purge and trap sampler. The results indicated that overload flow was effective in reducing the levels of these substances by 80-100% depending on the specific substance and the application rate. The removal mechanism was found to follow first order kinetics. The most likely mechanism to explain the observed behavior is volatilization. Comparison of the experimental results with theoretical prediction using published models resulted in reasonable agreement, considering the complexity of the system compared to the model systems. (Moore-SRC)

CAPROLACTAM RECOVERY FROM AQUEOUS MANUFACTURING STREAMS,
Union Carbide Corp., Tarrytown, NY.
J. H. Dibble.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-197999, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-062, April, 1980. 56 p, 15 Fig, 9 Tab, 8 Ref, Append, R-803737.

Descriptors: *Waste water treatment, *Industrial waste water, *Process water, *Waste recovery, *Pilot plants, Organic solvents, Effluent streams, Conservation, Adsorption, Physical properties.

A pilot plant was developed from the laboratory scale process for caprolactam recovery from aqueous wash streams. Caprolactam is extracted by dodecylphenol, a high-boiling solvent, and recovered from the extract by distillation. The resulting aqueous effluent caprolactam concentrations were as low as 30 ppm. Further treatment by activated carbon adsorption reduced the level to less than 2 ppm. Various physical properties, which are needed for this process design, were determined. Vapor pressures for the key components were determined using a special high-temperature, low-pressure (vacuum) apparatus. Other properties investigated include: density; solubilities of water in dodecylphenol and dodecylphenol in water; the interfacial tension of the water-caprolactam-dodecylphenol system; and the viscosities of pure dodecylphenol and dodecylphenol-heptane systems. This process is more efficient in extraction and less energy-consuming than current commercial processes. (Brambley-SRC)

THE FEASIBILITY OF A REGIONAL INDUSTRIAL WASTE WATER TREATMENT FACILITY,
Datagraphics, Inc., Pittsburgh, PA.
H. C. Bramer, and C. A. Caswell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-195787, Price codes: A05 in paper copy, A02 in microfiche. Environmental Protection Agency Report EPA-600/2-80-065, April, 1980. 76 p, 5 Fig, 21 Tab, 74 Ref, 1 Append. R804182.

Descriptors: *Waste water treatment, *Industrial waste water, *Waste water facilities, *Feasibility studies, *Monongahela River, Pennsylvania, Industrial plants, Sewer systems, Process water, Cooling water, Costs, Water quality standards.

The feasibility of establishing a regional industrial waste water treatment facility to serve the 68 industrial plants along the lower reaches of the Monongahela River, Pennsylvania, has been studied. A facility consisting of an interceptor sewer system following the river course with a treatment plant near the point at Pittsburgh is technically possible. The facility would best be designed to treat up to 568,000 cu m/day (150 mgd) of waste water consisting of 10% of the presently discharged process water and 10% of the presently discharged unsegregated, non-contact cooling water. The construction and operation would be best handled by the Allegheny County Sanitary Authority and funded by revenue bonds backed by long-term contracts from industrial users. Obstacles to the implementation of the scheme include the lack of effluent guidelines, and cost to and unwillingness to make long-term commitments by industry. While such a facility in this area is technically possible, it is neither economically nor institutionally feasible. (Brambley-SRC)

THE EFFECT OF PH ON THE COAGULATION AND PURIFICATION OF WASTEWATER,
Ministry of Works and Housing, Ibadan (Nigeria).
C. M. A. Ademoroti.
Effluent and Water Treatment Journal, Vol 20, No 11, p 541, 544-546, 549, November, 1980.

Descriptors: *Water purification, Acidity, *Coagulation, *Alum, Waste water treatment, *Ferric chloride, Water treatment, Water quality control, Waste treatment, Water pollution treatment, *Hydrogen ion concentration.

Alum and ferric chloride were used for the coagulation of wastewater. Two sets of samples were coagulated with 100, 200, 300, 400, 500 or 600 mg/l alum and with 50, 100, 200, 300, 400, and 500 mg/l ferric chloride. They were filtered through sand, and the effluents were analyzed. The doses giving the highest reductions in color, suspended solids, BOD and COD were 400 mg/l alum and 300 mg/l ferric chloride. When pH values were adjusted to 4.8, purest effluents were obtained at 200, 300 and 400 mg/l ferric chloride, as shown by COD values. Ferric chloride proved effective at lower concentrations than alum. The effluents of both coagulants were generally acidic in character, and the attainment of pH 4.8, where coagulation was optimum, created a medium for effective disinfection performance by hydrochlorous acid, an active species obtained during chlorination. The method of wastewater treatment by coagulation is simple and can be a suitable alternative for the secondary treatment in conventional methods of treatment. (Baker-FRC)

MODELING SEWAGE SLUDGE DECOMPOSITION IN SOIL: 1. ORGANIC CARBON TRANSFORMATION,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Soils and Crops.
Y. P. Hsieh, L. A. Douglas, and H. L. Motto.
Journal of Environmental Quality, Vol 10, No 1, p 54-59, January-March, 1981. 5 Fig, 3 Tab, 20 Ref. OWRT-A-038-NJ(4).

Descriptors: *Sewage sludge, *Degradation, *Model studies, Sludge treatment, Regression analysis, Biodegradation, Laboratory tests, Recycling, Waste treatment, Soil amendments, Activated sludge, Organic matter, Loam, Carbon.

To ensure beneficial results of waste recycling on agricultural land, the decomposition patterns of different types of sewage sludge in various soils should be examined under a number of environmental conditions. Laboratory mineralizations of an activated and a digested sludge were carried out in brown bottles, and decomposition was monitored through CO2 evolution measured by a modified biometer system. Greater mineralization was observed in the activated sludge than in the digested sludge due to its high active organic carbon content. After approximately 2 months, the mineralization rates of both sludges approached a square foot function of time. At 22 degrees, the mineralization of sewage sludges was found to be proportional to the application rate. At 8-22 degrees, the mineralization rate increased about 1.9 times for each 10 degree increase in temperature. Moisture levels of 0.06-0.33 bars had no significant effects on the mineralization rates of the sludges. A regression model was devised utilizing an exponential relationship of the cumulative organic carbon mineralized to the parameters of time, sludge rate and temperature. Due to its simplicity, the model may readily be applied to simulation analyses of sewage sludge decomposition in soil under various environmental conditions. (Geiger-FRC)

THE COMPARISON OF SOY-BEAN WASTES, USED TEA LEAVES AND SEWAGE SLUDGE FOR GROWING CHLORELLA PYRENOIDOSA,
Chinese University of Hong Kong, Shatin. Dept. of Biology.
M. H. Wong, and C. C. Lay.
Environmental Pollution (Series A), Vol 23, No 4, p 247-259, December, 1980. 9 Fig, 3 Tab, 19 Ref.

Descriptors: *Agriculture, *Algae, *Sludge, Nutrients, Metals, Organic matter, Industrial wastes, *Chlorella, Growth rates, Cultures, Waste water treatment, Activated sludge, Sewage sludge, Copper, Lead, Manganese, Iron, Trace elements, Heavy metals, *Soybean wastes, *Tea leaf wastes.

Chlorella pyrenoidosa, a unicellular green alga, was cultured in aqueous extracts of sewage sludge, soybean residues, and used tea leaves. The 2% soybean residue extract produced the highest growth rate, followed by 2% sludge extract, Bristol medium (control), and 1% tea leaves extract. Algal cells cultured in sludge extract contained higher levels of metals, Cu 0.06 mg per g, Mn 0.08 mg per g, and Fe 13.9 mg per g, than the soybean and Bristol medium substrates. Although the sewage sludge was of domestic water rather than industrial waste origin, it inhibited algal growth for the first few days. Studies of effects of metal concentrations on growth rates of algae showed that low levels accelerated growth but higher levels were inhibitory. The studies of effects of pH on growth rate showed that pH 7 supported better growth than pH 6.4. In more acidic media such as used tea leaf extract, growth was poor and trace metal solubilities enhanced, in spite of the presence of essential nutrients. (Cassar-FRC)

PHOSPHATE REMOVAL WITH CALCIUM CARBONATE PRECIPITATION IN THE LAKE OF CONSTANCE (OBERSEE). (PHOSPHATELIMINATION DURCH AUTOCHTHONE CALCITFALLUNG IM BODENSEE-OBERSEE),
Staatliches Inst. fuer Seenforchung und Fischereiwesen, Langenargen (Germany, F. R.).
H. Rossknecht.
Archiv fur Hydrobiologie, Vol 88, No 3, p 328-344, April, 1980. 3 Fig, 5 Tab, 17 Ref.

Descriptors: *Phosphorus, *Calcium carbonate, *Chemical precipitation, *Water pollution control, Lakes, Heavy metals, Acids, Separation techniques, Water treatment, Germany, Lake of Constance(Obersee).

The extent of phosphate coprecipitation in calcite was investigated because precipitation with CaCO3 can be used to remove organic acids or heavy metals from lake water. The phosphate content in the suspended matter and in the calcareous crusts on the leaves of Potamogeton lucens was determined by disintegrating the particles with carbon dioxide. Also, the phosphorus coprecipitation rate was measured in CaCO3 precipitation experiments with supersaturated lake water and Ca(HCO3)2 solutions. The concetration of particulate CaCO3 was determined in 1975 through 1978 in Lake Constance water, and the data were used to estimate the epilimnetic CaCO3 production. The amount of phosphorus eliminated by the lake's self-cleaning mechanism was estimated. (Small-FRC)

INDUSTRIAL WASTEWATER VS. THE POTW,
Black and Veatch Kansas City, MO.
J. Stukenberg, and J. D. Copeland.
American City and County, Vol 96, No 1, p 41-43, January, 1981. 1 Tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Design criteria, Activated sludge, Municipal wastes, Treatment facilities, Cities, North Kansas City, *Missouri.

Existing municipal waste water treatment works (publicly owned treatment works, POTW) can successfully accommodate additional industrial waste water or upgrade the effluent quality with appropriate modifications. This is especially desirable when the industries provide substantial employment for the local residents. An example is given featuring North Kansas City, Missouri, population 6,000 people and 20 industries. The treatment plant had experienced problems with variable influent quality and corrosion by acid wastes. The design for the enlarged plant was based on analysis of plant records and data from the larger industrial dischargers. All plans were discussed with the industries, and most decided that discharge into the municipal plant without pretreatment would be economical. An oxygen activated sludge system, secondary clarifiers, and modifications to the sludge handling system were planned. Influent pH will be continually monitored. Along with the plant enlargement and modification, the testing laboratory will be expanded. (Cassar-FRC)

POLAND LAUNCHES MAJOR PROGRAM TO RESTORE AND REGULATE COUNTRY'S LARGEST RIVER SYSTEM,
E. Pudlis.
Ambio, Vol 10, No 1, p 41-43, 1981. 2 Fig.

Descriptors: *Poland, *Water resources development, *Rivers, *Vistula River, *Water pollution control, Planning, Water policy, Surface waters, Waste water treatment.

Poland has initiated a program to clean up and improve the Vistula River. Plans include 30 stages of locks and dams, 16 reservoirs with a total annual capacity of 6 billion cubic meters, and a number of hydroelectric power stations. The present heavily polluted condition of the river will be improved with 188 new large group purification plants (capacity 5.7 billion cu meters), 200 industrial treatment plants for processing particularly toxic sewage, and desalination facilities to mitigate salt leaching from coal mines. First signs of improvement in water quality are expected to be evident in 1990. (Cassar-FRC)

RECONSTRUCTION OF MALDON STW,
M. D. Elder, J. G. Evance, and D. J. Cooper.
Effluent and Water Treatment Journal, Vol 20, No 12, p 587-589, December, 1980. 2 Fig, 1 Tab.

Descriptors: *Sewage treatment, *Aeration, Waste water treatment, Biological treatment, Costs, Economics, *Estuaries, Odor, Aerated lagoons, Design criteria, Water pollution, Domestic wastes, Sewage sludge, Maldon, *Great Britain.

The town of Maldon on the estuary of the Blackwater supports various light industries and recreation through its boating facilities. Untreated sewage from the town found its way into the estuary and caused pollution and odor problems. In the 1960's, a biological filter installation was opened near Osea Island to handle flow from a population of 13,500. By 1969, the capacity of the plant had been exceeded. In 1974, a commission set up by the Essex Sewage Division studied the problem at Osea and reported on the options that might be taken within the appropriate cost limitations to upgrade the treatment of the town's waste water facilities to handle a population of 18,000. An extended aeration process was recommended which would reduce manpower requirements, eliminate odoriferous primary sludges, reduce fly nuisance, and allow disposal of a well oxidized sludge onto farm land. Design criteria were chosen and the uprated facility was located four kilometers from Maldon to serve the catchment area of Maldon and Heybridge. After 13 months of operation, the quality of the plant effluent has remained within the set standards and averages 11 milligrams/liter suspended solids and 7 milligrams/liter biochemical oxygen demand. Some minor problems have occurred with instrumentation and small trash deposition on sludge return valves, but these difficulties are being handled by further research. (Geiger-FRC)

5E. Ultimate Disposal Of Wastes

PERMEABILITY OF COVERS OVER LOW-LEVEL RADIOACTIVE-WASTE BURIAL TRENCHES, WEST VALLEY, CATTARAUGUS COUNTY, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
D. E. Prudic.
Geological Survey Water-Resources Investigations 80-55, 1980. 35 p, 12 Fig, 4 Tab, 18 Ref.

Descriptors: *Permeability, Hydraulic conductivity, Porosity, *Infiltration, Atmospheric pressure, *Radioactive waste disposal, Soil water movement, Groundwater movement, Water levels, Groundwater recharge, Till, Hydrogeology, Evaluation, *New York, West Valley, Cattaraugus County, Burial trenches, Trench cover.

Among the facilities at the Western New York Nuclear Service Center, near the hamlet of West Valley in the northern part of Cattaraugus County, N.Y., is a State-licensed burial ground for commercial low-level radioactive wastes. The 11-acre burial ground contains a series of trenches excavated in a silty-clay till of low permeability that contains scattered pods of silt, sand, and gravel. Gas pressure in the unsaturated parts of radioactive waste burial trenches responds to fluctuations in atmospheric pressure. Measurements of atmospheric pressure and the differential pressure between the trench gas and the atmosphere on several dates in 1977-78 were used to calculate hydraulic conductivity of the reworked silty-clay till that covers the trenches. Generally the hydraulic conductivity of covers over trenches that had a history of rapidly rising water levels are higher, at least seasonally, than covers over trenches in which the water level remained low. This supports the hypothesis that recharge occurs through the cover, presumably through fractures caused by desiccation and (or) subsidence. Hydraulic conductivities of the cover as calculated from gas- and air-pressure measurements at several trenches were 100 to 1,000 times greater than those calculated from the increase in water levels in the trenches. This difference suggests that the values obtained from the air- and gas-pressure measurements need to be adjusted and at present are not directly usable in groundwater flux calculations. The difference in magnitude of values may be caused by rapidly decreasing hydraulic conductivity during periods of recharge or by the clogging of fractures with sediment washed in by runoff. (USGS)

ELEMENTAL CONTENT OF VEGETABLES AND APPLE TREES GROWN ON SYRACUSE SLUDGE-AMENDED SOILS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Office of Occupational Health and Safety.
A. K. Furr, T. F. Parkinson, D. C. Elfving, C. A. Bache, and W. H. Gutenmann.
Journal of Agricultural and Food Chemistry, Vol 29, No 1, p 156-160, January-February, 1981. 6 Tab, 23 Ref.

Descriptors: *Heavy metals, *Soil amendments, *Absorption, *Sewage sludge, Vegetable crops, Apples, Fruit crops, Hydrogen ion concentration, Sludge treatment, *Fertilizers, Municipal wastes, Polarographic analysis, Syracuse, New York.

The magnitude of Cd, Cu, Ni, Pb, and Zn uptake by a variety of vegetables and apple trees grown in soils amended with municipal sludge at pH values of 6.4 and 6.9 was examined. Two successive crops of peppers, kohlrabi, lettuce, peas, spinach, sweet potatoes, and turnips and two commercial apple cultivars were grown in neutral or sludge-amended soils or their mixtures in pots under laboratory conditions. Analysis for the metals in the edible portion of the drops was performed by conventional stripping voltammetry. Cd, Cu, Ni, and Zn levels were higher in the edible portions of sludge-grown crops. Cd, Ni, and Zn were generally elevated in vegetable crops grown on sludge fortified acid soil. Cu was elevated in the vegetables raised on the sludge-neutral soil mixture. During the second year of growth, Ni and Zn were decreased in vegetable crops and apple trees grown on sludge amended soil. Variations of heavy metals in apple trees showed no consistent relationship with soil pH. Zn and Cu tended to concentrate in apple twigs, while Pb and Ni were found at concentrated levels in apple tree leaves. Since leafy vegetables such as lettuce or spinach absorb very high levels of Cd, Zn and Cu, the growth of these crops on municipal sludge amended soils should be avoided. (Geiger-FRC)

MODELING SEWAGE SLUDGE DECOMPOSITION IN SOIL: II. NITROGEN TRANSFORMATIONS,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Soils and Crops.
Y. P. Hsieh, L. A. Douglas, and H. L. Motto.
Journal of Environmental Quality, Vol 10, No 1, p 59-64, January-March, 1981. 3 Fig, 4 Tab, 25 Ref. OWRT-A-038-NJ(5).

Descriptors: *Denitrification, *Sewage sludge, *Model studies, Recycling, Soil amendments, Activated sludge, Sludge disposal, Nitrification, Nitrogen, Agriculture, Degradation, Kinetics, Laboratory tests, Sludge treatment, Organic matter.

The recycling of sewage sludge on agricultural land has been used as a method to ease some of the problems of sewage sludge disposal. The ability of soil to decompose sewage sludge was studied in laboratory tests. The transformation of nitrogen was studied in sandy loam soils amended with an anaerobically digested or an activated sewage sludge. The active organic carbon content and moisture level of the sludge-soil system was found to influence the duration of the lag phase of nitrification. The potential for mineralization of nitrogen was 30% of the organic nitrogen in the activated sludge and 38% of the organic nitrogen in the digested sludge. At 21 degrees, the mineralization rate constant was 0.026/day, corresponding to a 27-day half life. Moisture levels of 0.06 and 0.33 bars had no significant effect on the rate of nitrogen mineralization. Under unsaturated conditions, denitrification and nitrification could proceed either alternatively or simultaneously in the system. A model which assumed either zero or first order kinetics was devised to describe the nitrogen transformations of sludge-soil systems. The model was usually accurate in predicting the amount of ammonia, nitrate, nitrite, and organic nitrogen in the system and their rate of production. It was suggested that denitrification might be an important pathway of nitrogen transformation in sewage sludge-soil systems. (Geiger-FRC)

ATMOSPHERIC EMISSIONS OF ELEMENTS ON PARTICLES FROM THE PARKWAY SEWAGE-SLUDGE INCINERATOR,
Maryland Univ., College Park. Dept. of Chemistry.
R. R. Greenberg, W. H. Zoller, and G. E. Gordon.
Environmental Science and Technology, Vol 15, No 1, p 64-70, January, 1981. 1 Fig, 8 Tab, 26 Ref.

Descriptors: *Incineration, *Sludge disposal, *Ultimate disposal, Air pollution, Path of pollutants, Burning, Disposal, Waste water treatment, Metals, Heavy metals, Mercury, Lead, Pollutant identification, Public health, Parkway Waste Water Treatment Plant, Maryland.

Incineration of sewage sludge at the rate of 600 kg per hour at the Parkway Waste Water Treatment Plant, Laurel, Maryland, produced particulate emissions as follows (in grams per day): Hg 50, Pb 2, Na 8.2, Mg 4.8, Ca 6.5, Ba 7.3, Al 16, Ti 1.7, Cl 2, Fe 37, Zn 1.5. Other elements found in quantities less than 1 gram per day were Br, V, Cr, Mn, Co, Sc, Cu, Se, Ag, Cd, In, Sb, Ce, Eu, Yb, and Ta. The ash that escaped the scrubber system was less than 1% of the total 180 kg of ash produced from burning 600 kg sludge. The major point of the study was to determine if emissions from sewage sludge incinerators posed a threat to the community. Compared with emissions from coal-fired power plants, autos burning leaded gas, and municipal refuse incinerators, the emissions of Se, Sb, H_g, and Pb from sludge burning were minimal, and thus were considered no serious hazard to local residents. The most significant exposure was Hg at 50 g per day, for which airborne concentrations at ground level were slightly higher than ambient. (Cassar-FRC)

5F. Water Treatment and Quality Alteration

FRANKLAW WATER TREATMENT WORKS.
Effluent and Water Treatment Journal, Vol 20, No 11, p 558-559, 561, November, 1980.

Descriptors: *Water treatment, *Water purification, Filters, Clarifiers, Sludge, Effluents, Water quality control, Water pollution treatment, Water pollution sources, Franklaw, United Kingdom.

The Franklaw Water Treatment Works operation is described. Raw water is taken from the River Wyre at the Garstang pumping station and transferred to the Franklaw treatment works via a 1400 mm steel main. The delivery main divides into three separate 800 mm mains at the works, each of which is equipped with a flow measuring Venturi and remote-operated flow control valves. The plant is designed to be under automatic control, being operated from a control room with a minimum of personnel involved. Strict water economy is enforced. The plant has been designed so that the flow can be adjusted to between 285 and 20 million liters per day and can be started up in half an hour to give drinkable water. The method of flocculation/clarification in the Degremont Superpulsator, a high speed clarifier, is described. The function of the Superpulsator is to allow the hydroxide flocs to separate from the water being treated. Clarification can simply be achieved by static tanks which operate on a batch principle. The flocculated water enters the tank and stands for a time long enough for the floc to settle out at the bottom of the tank as a sludge. The sludge blanket of a depth of approximately 3 m is controlled by sludge hoppers which are effectively troughs, the top edge of the trough being at the desired level of the blanket. There is a natural overflow of sludge into these troughs, where it is allowed to concentrate in order to reduce its volume prior to discharge. (Baker-FRC)

5G. Water Quality Control

GEOCHEMISTRY OF FLUORIDE IN THE BLACK CREEK AQUIFER SYSTEM OF HORRY AND GEORGETOWN COUNTIES, SOUTH CAROLINA--AND ITS PHYSIOLOGICAL IMPLICATIONS,
Geological Survey, Columbia, SC. Water Resources Div.
A. L. Zack.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.50. Geological Survey Water-Supply Paper 2067, 1980. 40 p, 11 Fig, 1 Plate, 2 Tab, 24 Ref.

Descriptors: *Geochemistry, *Fluorides, *Groundwater, *Water quality, *South Carolina, Aquifer characteristics, Water wells, Chemical analysis, Mineralogy, Horry County(SC), Georgetown County(SC).

High concentrations of fluoride in groundwater supplies in certain areas of Horry and Georgetown Counties, S.C., have been the cause of dental fluorosis (tooth mottling) among persons who have lived in these areas and have ingested the water as children. Geochemical evidence and laboratory experiments demonstrate that fluorapatite in the form of fossil shark teeth is the source of fluoride, and that the fluoride ions are liberated to the groundwater system through anion exchange, rather than by dissolution. Calcite-cemented quartz sand in the upper third of the Black Creek Formation of Late Cretaceous age contains the fossil shark teeth. As groundwater progresses downdip, the calcite matrix dissolves and hydrolyzes, releasing bicarbonate, hydroxyl, and calcium ions. The calcium ions are immediately exchanged for sodium ions adsorbed on sodium-rich clays, and the bicarbonate ions accumulate. As the shark teeth are exposed, the hydroxyl ions in solution exchange with fluoride ions on fluorapatite surfaces. Experiments using fossil shark teeth show that sodium chloride in solution inhibits the rate of exchange of fluoride ions from tooth surfaces for hydroxyl ions in solution. The amount of fluoride removed from water and exchanged for hydroxyl ions in the presence of pure hydroxylapatite (hog teeth) was greater in saline water than in freshwater. (USGS)

WATER-RESOURCES INVESTIGATIONS, COLLIER COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. Klein.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $4.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File

Report 80-1207, 1980. 29 p, 15 Fig, 17 Ref.

Descriptors: *Water resources, *Investigations, *Groundwater availability, *Water quality, *Florida, Aquifer characteristics, Water levels, Water table, Saline water intrusion, Canals, Drainage, Data collections, Sites, *Collier County(FL), Southwest Florida, Floridan aquifer.

Early water-resources investigations in Collier County, Fla., were related to saltwater intrusion in Naples. With the advent of canal drainage and land reclamation farther inland, investigations were directed at effects of canals on water resources and the environment. High on the list of investigative needs are: (1) areal and vertical delineation of the shallow aquifer, the prime source of freshwater; (2) delineation of areas of poor quality ground water and the sources of the poor quality; (3) establishment of network of hydrologic data stations; and (4) determination of the relation between canals and the shallow aquifer. WATER QUALITY OF A RESERVOIR USED FOR RECLAIMED WATER STORAGE,
California Univ., Irvine. School of Engineering.
P. S. Dixon, and J. Scherfig.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-197618, Price codes: A04 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis Technical Completion Report, April, 1980, 64 p, 3 Fig, 17 Tab. (California Water Resources Center Project UCAL-WRC-W-551). OWRT-A-070-CAL(1).

Descriptors: *Water quality, *Reclaimed water, *Reservoirs, Algal growth, Reservoir storage, Dissolved solids, Suspended solids, Chemicals, Reservoir operation, California.

The water quality of two reservoirs receiving differing amounts of reclaimed water is compared with a neighbouring reservoir receiving none. Monthly sampling of chemical parameters is presented, together with analyses of dissolved and suspended solids (the latter fractionated into sized components). Quantitative estimation of algal populations presented little significant information although measurement of algal growth potential, using the Selenastrum capricornutum 'bottle test', gave data of considerable importance for reservoir management. CHEMICAL TREATMENTS OF SOIL TO DECREASE RADIOSTRONTIUM LEACHABILITY,
Oak Ridge National Lab., TN. Environmental Science Div.
B. P. Spalding.
Journal of Environmental Quality, Vol 10, No 1, p 42-46, January-March, 1981. 3 Fig, 2 Tab, 12 Ref.

Descriptors: *Nuclear wastes, *Leaching, Path of pollutants, Groundwater pollution, Water quality control, Anions, Cations, Laboratory tests, Radioactive wastes, Water pollution, Radioactive waste disposal, Calcium carbonate, Water pollution control.

The shallow land burial of radioactive wastes often results in the leaching of radiostrontium into soils and groundwaters. A study was conducted by the Oak Ridge National Laboratory (ORNL) to investigate methods of arresting the leaching of 90Sr in situ. Three soils were collected from the solid waste disposal area at ORNL and were labeled with 85Sr and placed into small columns. The soil columns were percolated with equal amounts of sodium salt solutions of hydroxide, fluoride, carbonate, phosphate, silicate and aluminate before leaching with 0.1 N CaCl2. Only 30-35% of the 85Sr could be leached from two soils which were high in indigenous exchangeable calcium cations. The 85Sr was presumably precipitated along with the nascent CaCO3 produced during treatment. However, over 98% of the 85Sr was leached from all of the untreated soils. In general, less 85Sr was fixed by the other anions than by the carbonate treatment. These findings suggest that sodium carbonate may be a potential immobilizer of 90Sr in situ in soils contaminated by nuclear wastes. (Geiger-FRC)

FUNGAL PATHOGEN OF CLADOPHORA GLOMERATA (CHLOROPHYTA),
Academy of Natural Sciences of Philadelphia, Avondale, PA. Stroud Water Research Center.
T. L. Bott, and K. Rogenmuser.
Applied and Environmental Microbiology, Vol 40, No 5, p 977-980, November, 1980. 2 Fig, 28 Ref.

Descriptors: *Eutrophication, *Algal control, Laboratory tests, Aquatic fungi, Biocontrol, Pathogenic fungi, Lakes, Cladophora.

The pathogenic activity of Acremonium kiliense (Fungi Imperfecti) against Cladophora glomerata was investigated in laboratory tests and under more natural conditions. In the laboratory tests, fugal pathogenicity was demonstrated most clearly by cell condition and chlorophyll alpha concentration. More than 85% of the Cladophora cells were bleached at the highest inoculum level when conidia were added. In two microcosm experiments, after one week the C. glomerata in the inoculated flowing-water was almost completely chlorotic. In the controls, few cells were chlorotic. Further research with biological agents and algae capable of causing problem growths may yield new control procedures. During the course of these studies, the virulence of A. kiliense decreased. Thus variation in tolerance or adaptation of the target organism must be investigated. (Small-FRC)

6A. Techniques Of Planning

USING CHANNEL GEOMETRY TO ESTIMATE FLOOD FLOWS AT UNGAGED SITES IN IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
W. A. Harenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-153736, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-32, August 1980. 39 p, 6 Fig, 1 Plate, 3 Tab, 31 Ref.

Descriptors: *Channel morphology, *Estimating equations, *Flood flow, *Flood frequency, *Idaho, River basins, Analytical techniques, Flood forecasting, Flood discharge, Peak discharge, Flow characteristics, Basin characteristics, Channel geometry, Bankfull discharge, Bankfull width.

Measurements at bankfull stage were made at 136 sites in Idaho to determine whether predictions of flood discharge using channel-geometry characteristics are as good as or better than predictions using basin characteristics. These measurements are used to determine the variables of bankfull width, area, depth, and velocity. These variables are combined with basin characteristics for the sites, and multiple-regression techniques are used to select the best combination of variables to estimate the 10-year flood. To achieve the lowest standard error of estimate, the data set is divided into segments based on percentage of forest cover. Generally, discharge estimates obtained from equations using channel characteristics have smaller standard errors than those using basin characteristics. (USGS)

COMPUTER ROUTINES FOR PROBABILITY DISTRIBUTIONS, RANDOM NUMBERS, AND RELATED FUNCTIONS,
Geological Survey, Reston, VA. Water Resources Div.
W. Kirby.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $8.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-448, 1980. 61 p, 16 Ref.

Descriptors: *Computer programs, *Statistics, *Probability distribution, Data processing, Hydrologic data, Mathematical studies.

Use of previously codes and tested subroutines simplifies and speeds up program development and testing. This report presents routines that can be used to calculate various probability distributions and other functions of importance in statistical hydrology. The routines are designed as general-purpose Fortran subroutines and functions to be called from user-written main programs. The probability distributions provided include the beta, chi-square, gamma, Gaussian (normal), Pearson Type III (tables and approximation), and Weibull. Also provided are the distributions of the Grubbs-Beck outlier test, Kolmogorov's and Smirnov's D, Student's t, noncentral t (approximate), and Snedecor F tests. Other mathematical functions include the Bessel function I (subzero), gamma and log-gamma functions, error functions and exponential integral. Auxiliary services include sorting and printer plotting. Random number generators for uniform and normal numbers are provided and may be used with some of the above routines to generate numbers from other distributions. (USGS)

STUDY PLAN FOR THE REGIONAL AQUIFER-SYSTEM ANALYSIS OF ALLUVIAL BASINS IN SOUTH-CENTRAL ARIZONA AND ADJACENT STATES,
Geological Survey, Tucson, AZ. Water Resources Div.
T. W. Anderson.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $3.50 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-1197, October, 1980. 22 p, 5 Fig, 27 Ref.

Descriptors: *Project planning, *Aquifer management, *Regional analysis, *Hydrogeology, Aquifer characteristics, Surface groundwater relationships, Groundwater availability, Drawdown, Groundwater movement, Water utilization, Water supply, Water quality, Model studies, Data collections, Water resources development, Water management(Applied), Arizona, California, Nevada, New Mexico, *Southwest U.S.

The U.S. Geological Survey has started a 4-year study of the alluvial basins in south-central Arizona and parts of California, Nevada, and New

Mexico to describe the hydrologic setting, available groundwater resources, and effects of historical development on the groundwater system. To aid in the study, mathematical models of selected basins will be developed for appraising local and regional flow systems. Major components necessary to accomplish the study objectives include the accumulation of existing data on groundwater quantity and quality, entering the data into a computer file, identification of data deficiencies, and development of a program to remedy the deficiencies by collection of additional data. The approach to the study will be to develop and calibrate models of selected basins for which sufficient data exist and to develop interpretation-transfer techniques whereby general predevelopment and postdevelopment conceptual models of the hydrologic system in other basins may be synthesized. The end result of the project will be a better definition of the hydrologic parameters and a better understanding of the workings of the hydrologic system. The models can be used to study the effects of management alternatives and water-resources development on the system. (USGS)

DEVELOPMENT OF A STREAMFLOW FORECASTING PROCEDURE FOR INTERMOUNTAIN BASINS,
Montana State Univ., Bozeman. Dept. of Civil Engineering.
A. B. Cunningham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198442. Completion Report, December, 1980. Montana Water Resources Research Center, Montana State University Report No 113. 26 p, 13 Fig, 7 Ref. OWRT A-116-MONT(1), 14-34-0001-9028.

Descriptors: *Streamflow forecasting, *Snowmelt, *Runoff forecasting, *Computer models, *Basins, Catchment areas, Forecasting, Streamflow, Flow, Overland flow, Thaw, Snowpack, Snow cover, Predictions, Computer programs, Model studies, Montana.

This research study sought to develop and test a method for forecasting the magnitude and profile of streamflow hydrographs occurring primarily as result of snowmelt runoff. Hence, the scope of the desired forecasting procedure was narrow by comparison with National Weather Service forecasting procedures. The study should be viewed as a contribution toward systematic water resources management in that it functions in supplying hydrologic data critical to operation of various types of surface water retention/regulation facilities. Properly calibrated, the developed procedure allows for forecasting daily streamflows over a 5-7 day forecast period in regions for which hydrologic data are limited. Basic data needed include: study-site daily streamflow values; mean daily temperatures; maximum snowpack water equivalent at onset of melt season. A developed computer-graphics-oriented algorithm was used to test the methodology, but the few calculations needed during routine forecasting can be handled without a computer, if desired. Three southwest Montana drainage basins were analyzed during the Spring 1980 runoff period. Favorable results were obtained concerning the adequacy of the streamflow forecasting procedure. (Zielinski-IPA)

CONTROL OF THE WATER RESOURCES OF THE AZOV SEA USING THE 'AZOV PROBLEM' FAMILY OF SIMULATION SYSTEMS,
Rostov-on-Don State Univ. (USSR). Inst. of Mechanics and Applied Mathematics.
A. B. Gorstko, F. A. Surkov, L. V. Epshteyn, and A. A. Matveyev.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, Aug 27-30, 79, Bloomfield Hills, MI. EPA Report 600/9-80-033, Jul 80. p 252-260, 2 Fig, 7 Ref.

Descriptors: *Water resources development, *Simulation, *Regional development, Water management, Water quality, Water conservation, Industrial water, Water use, Agriculture, Fisheries, Powerplants, Regional planning, Ecological effects, Information systems, Azov Sea basin, *Russia.

A well-developed industrial and agrarian complex has grown up in the Azov Sea drainage basin (USSR). Significant volumes of fresh water, which must be of high quality, are necessary for normal functioning and further development of industry, agriculture, power engineering, fishing, water transport, and normal living conditions. However, the region is poor in fresh water resources. The range of problems related to the use of water resources in the Azov Sea basin, conservation or conscientious reconstruction of the ecosystem of the Azov Sea, and the development of macroregional programs of supplementing the continental runoff in the basin is referred to as the Azov problem. Solution of the Azov problem requires systematic development of a multitude of versions of regional ecologic policies and water management strategies in the basin, and evaluation of the probable effects of these versions in combination with macroregional projects. The basic principle of organization of all scientific plans and plan development on the Azov problem should be the idea of the man-machine system. This should include structural subsystems, decision making personnel at various levels; experts on the Azov problem as a whole, and experts on its individual aspects; plan developers; 'Azov problem' simulation systems; and information bank; and persons who plan and conduct experiments with the simulation systems. ADEQUACY AND ECONOMICS OF WATER SUPPLY IN NORTHEASTERN ILLINOIS, 1985-2010,
Illinois State Water Survey, Urbana.
K. P. Singh, and J. R. Adams.
Illinois Institute of Natural Resources, Report of Investigation 97, 1980. 205 p, 47 Fig, 68 Tab, 39 Ref, 2 Append.

Descriptors: *Economics, *Aquifers, *Illinois, *Model studies, *Groundwater, Subsurface water, Radioactivity, Systems analysis, Value engineering, Water conveyance, Water costs, Water allocation(Policy), Water management(Applied), Water supply, Water treatment.

Plans were developed for optimal use of available groundwater and surface water resources for adequate and dependable water supply to all towns in Cook, DuPage, Kane, Lake, McHenry, and Will Counties. An efficient water-demand model, based on a town's population and industrial employment, was used for future demand projections. The potential yield of sand and gravel and Silurian dolomite aquifers was investigated. Cost functions were developed in terms of July 1980 dollars for wells, pumps, water conveyance system components, reservoirs, and treatment plants. Out of a total of 273 towns, 96 are presently served with lake water either directly or from Chicago. The groundwater supply from shallow aquifers is adequate for 85 towns. Thus, 92 towns need other sources of water if the safe yield of the deep sandstone aquifer is not to be exceeded. Six optimal regional systems to meet these demands were developed. The Fox Valley system considers conjunctive use of groundwater, as well as direct supply from Lake Michigan. The Kankakee River system considers water withdrawal from the river near Wilmington. The other four systems---Lake County, Northwestern Cook County, DuPage County, and Southern Cook County---obtain water from the lake directly or from Chicago. With the proposed individual groundwater and regional surface water systems, there is ample water for all towns in northeastern Illinois to meet their water demands for the next 30 or more years, without mining of the deep aquifer. (Author's abstract)

DEVELOPMENT OF A GROUNDWATER MODEL FOR THE HENRY'S FORK AND RIGBY FAN AREAS, UPPER SNAKE RIVER BASIN, IDAHO,
Idaho Univ., Moscow. Water and Energy Resources Research Inst.
J. Wytzes.
Research Technical Completion Report, Submitted to Idaho Department of Water Resources, August, 1980. 205 p, 24 Fig, 19 Tab, 115 Ref, 5 Append.

Descriptors: *Idaho, *River basins, *Water table fluctuations, *Groundwater basins, *Simulation analysis, Model studies, Streamflow, Permeability coefficient, Evapotranspiration, Storage coefficient, Geohydrologic units, Specific yield, Diversion losses, Snake River basin.

The study describes the essential aspects of a groundwater flow system in the subject area. It provides for a water resources planning and management tool in the form of a digital simulation model that can be used for efficient administration and management of local groundwater resources. A finite difference model, based upon the alternating direction technique, is used to simulate the basic mathematical equations governing groundwater flow in an isotropic, homogeneous water table aquifer. The model includes an iterative calibration procedure to adjust initial estimates of geohydrologic parameters, such as hydraulic conductivity, leakance factors, and storage coefficients in such a way that the deviations between simulated and measured 'historic' water levels are within a predetermined range. Historic water tables were measured during a selected calibration period from May 1977 through April 1978. Water budget components, such as irrigation diversions, stream flows, water conveyance system losses and climatological data were compiled in the input routine. The resulting model provides a reliable tool for research, planning and administrative purposes. (Garrison-Omniplan)

A WATER QUALITY PLANNING METHODOLOGY FOR URBAN AREAS,
CH2M/Hill, Reston, VA.
F. W. Ellis, and R. L. Wycoff.
In: Urban Stormwater and Combined Sewer Overflow Impact on Receiving Water Bodies, Proceedings of the National Conference, Orlando, Florida, November 26-28, 1979, Environmental Protection Agency Report EPA 600/9-80-056, December 1980. p 590-617, 11 Fig, 7 Ref. 68-01-3993.

Descriptors: *Cost-benefit analysis, *Urban runoff, *Water quality management, *Cost analysis, Evaluation, Water quality control, Water pollution sources, Water pollution control, Hydrology, Sewer systems, Planning, Case studies, Philadelphia, Des Moines.

Because of the very large sums of money required to improve urban water quality, and the difficulty of raising money for such projects it is necessary that the projects demonstrate perceptible improvements in water quality, are required for the protection of the intended beneficial use of the receiving water, and make use of the most cost-effective pollution control methods. A two-phase approach has been developed to assess water quality problems and potential solutions. Phase I determines the beneficial uses of the receiving water; establishes water quality goals; determines the nature, sources, and extent of water quality problems; estimates the degree of pollution abatement required; determines the most cost-effective mix of control alternatives; and provides for evaluation of the project. If Phase I indicates that there are water quality problems that can be corrected with affordable solutions, the detailed analysis of Phase II is required. This phase considers the area's hydrol-

ogy, combined and separate sewer system hydraulics, nonpoint and point source pollutants, and the receiving water quality response. Case studies for Philadelphia, Pennsylvania, and Des Moines, Iowa, are used to illustrate the analyses and the site-specific nature of the water quality planning process. (Brambley-SRC)

SMALL SCALE HYDROPOWER DEVELOPMENT IN ILLINOIS: AN IMPLEMENTATION MANUAL,
WAPORA, Inc., Chicago, IL.
G. Lindsey.
Illinois Institute of Natural Resources Document No 80/30, December 1980. 180 p, 13 Fig, 7 Tab, 121 Ref, 3 Append.

Descriptors: *Illinois, *Hydroelectric plants, *Energy sources, *Environmental surveys, Feasibility studies, Licensing, Project benefits, Economic aspects, Hydraulic engineering, Dam effects, Dam construction, Permits, Reservoir siting.

Renewed interest in small-scale hydropower is growing rapidly as an alternative to the use of non-renewable fuels such as coal, uranium, oil, and gas. Preliminary studies in Illinois indicate that the development of a minimum of 57 to 130 megawatts of renewable, small-scale hydroelectric generating capacity is, or soon will be, economically feasible at existing dam sites. This implementation manual, written for readers with non-technical backgrounds, is intended to assist potential developers of existing dam sites, who may be newly acquainted with hydropower, in the implementation of small-scale hydropower projects. The manual is divided into nine sections: (1) a user's guide; (2) a conceptual description of a small-scale hydropower plant; (3) a summary of recent Federal and State programs designed to encourage small-scale hydropower development; (4) a review of the significance and potential of small-scale hydropower resources in Illinois; (5) techniques for making preliminary assessments of site potential; (6) regulatory considerations; (7) environmental considerations; (8) potential sources of financing; and (9) considerations for implementation. (Garrison-Ominplan)
W81-02788

PHASE I REPORT - INVENTORY OF POTENTIAL SMALL-SCALE HYDROPOWER SITES IN ILLINOIS AND SELECTION OF PROJECTS EXHIBITING POTENTIAL FOR DEVELOPMENT,
WAPORA, Inc., Chicago, IL.
G. Lindsey, G. M. Kelly, and D. Sweeney.
Illinois Institute of Natural Resources Document No 81/03, January, 1981. 29 p, 1 Fig, 5 Tab, 40 Ref, 2 Append.

Descriptors: *Illinois, *Hydroelectric power, *Hydroelectric plants, *Electric power production, *Feasibility studies, Power plants, Flow duration, Hydraulics, Damsites, Rivers, Water resources development, River basin development, Flow characteristics.

Interest in developing small-scale hydroelectric power has increased recently because of rapidly rising fossil and nuclear fuels costs, and constraints on sitings of new power plants. This report lists 114 potential small-scale sites, with existing dams, in Illinois. Fifteen sites exhibited the greatest economic potential for hydroelectric development. The combined generating capacity for the 57 sites for which head and flow data are available is estimated to be 176 MW; their mean capacity is 3.19 MW. Twenty-five sites have a potential capacity of more than 350 KW, while 21 sites have a potential capacity of less than 100 KW. Storage pools, which can be used to generate peak load power, exist at only 35 of the sites. Descriptions of seven hydropower feasibility or development projects now underway are included, as well as a narrative on the historical perspective of water power in Illinois. This report is the first of a three-part project entitled 'Low Head Hydroelectric Generation Potential in Illinois.' Phase II and Phase III report on the potential sites identified here, and describe procedures for implementation. (Garrison-Omniplan)

PHASE II REPORT - PRELIMINARY INVESTIGATION OF SMALL-SCALE HYDROPOWER POTENTIAL AT FIVE SITES IN ILLINOIS,
WAPORA, Inc., Chicago, IL.
G. Lindsey, and D. Sweeney.
Illinois Institute of Natural Resources Document No 81/05, January, 1981. 111 p, 33 Fig, 2 Tab, 50 Ref, 60 Append.

Descriptors: *Illinois, *Hydroelectric power, *Feasibility studies, Evaluation, Hydrologic data collections, *Economic aspects, Cost analysis, Hydroelectric plants, Electric power production, Flow duration, Hydraulics, Damsites, Rivers, Water resource development.

This is the second phase of a three-part study entitled 'Low-Head Hydroelectric Generation Potential in Illinois.' The report presents preliminary engineering, cost/benefit, and environmental analyses of the hydropower potential at five sites selected from the 114 sites identified in Phase I as having potential for hydropower production. The 114 original sites were screened to select those with the greatest relative potential for economic development. Sites with an estimated capacity of less than 350 kw were eliminated, as were sites with an average annual flow of less than 100 cubic feet/second. The engineering analyses on the five selected sites include descriptions of the existing structures and potential development alternatives at each site, along with conceptual design sketches. The five sites selected were the Oregon Dam on the Rock River in Oregon, the Upper-Sterling Dam on the Rock River at Sterling-Rock Falls, the Wilmington Dam on the Kankakee River at Wilmington, the Kankakee Dam on the Kankakee River at Kankakee, and the Elgin Dam on Fox River at Elgin. The break-even revenue requirement for each site is presented. Phase III will consist of a how-to manual to guide the implementation of additional hydropower plants in Illinois. (Garrison-Omniplan)

THE LONG RUN PROFITABILITY OF WESTERN IRRIGATED AGRICULTURE: AN IN-DEPTH ANALYSIS,
Arizona Univ., Tucson. Coll. of Agriculture.
Y. Goldschmidt, and W. E. Martin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193948, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, 1980. 57 p, 1 Fig, 13 Tab, 22 Ref. OWRT-B-080-ARIZ(5), 14-34-0001-0203.

Descriptors: *Economic evaluation, *Profit, *Irrigation practices, Income distribution, Agriculture, Farm management, Cost analysis, Economic aspects, Irrigation, Irrigable land, Income, Farming, Farms, Costs, Estimated costs, Accounting, Budgeting, Investment, Mathematical studies, Numerical analysis, Economic prediction, Economic yield.

The purpose of this study focused on the development of consistent conceptual procedures for analyzing profitability of irrigated farms during inflation, for developing cost budgets of such farms and for evaluating investment in water projects. Models of the organizations, costs, and returns of representative farms developed by agricultural economists for most western irrigated areas have generally shown little or no return to long-run capital investment (including irrigation development); yet it is observed that farmers do remain in business, make capital investments, and favor irrigation development. It was concluded that standard economic budgets do not give an accurate picture of reality. Three major variables are normally excluded from standard budgets: (1) long-run wealth development (versus short-run net income); (2) effects of income tax laws on short-run income and long-run wealth; and (3) the budget-distorting effects of inflation. Procedures for incorporating these three variables into budget analysis were developed and shown. The exclusion of each of these variables causes underestimation both of the income and wealth position of farmers. (Zielinski-IPA)

THE SEARCH FOR EQUITY AND EFFICIENCY IN THE PRICING OF A PUBLIC SERVICE: URBAN WATER,
Pennsylvania Univ., Philadelphia.
S. L. Feldman, J. Breese, and R. Obeiter.
Economic Geography, Vol 57, No 1, p 78-93, 1981. 2 Fig, 2 Tab, 23 Ref.

Descriptors: *Pricing, *Water rates, Marginal costs, Utilities, Unit costs, Economics, Costs, Water distribution(Applied), *Washington, D. C., Cost-benefit analysis, *Municipal water.

Practical ways of implementing the marginal cost pricing scheme are presented for urban water. Prices are based upon incremental costs for each rating period, the peak users bearing all capacity charges. As applied to the Washington Suburban Sanitary Commission, Washington, D. C., use of marginal cost pricing would produce an annual welfare gain of $1.85 million, justifying implementation of the plan requiring expensive demand meters. (Cassar-FRC)

APPRAISAL OF GROUND-WATER RESOUCES IN THE SAN ANTONIO CREEK VALLEY, SANTA BARBARA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
C. B. Hutchinson.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $7.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-750 (WRI), August 1980. 48 p, 14 Fig, 5 Tab, 16 Ref.

Descriptors: *Groundwater resources, *Water yield, *Water utilization, *Water demand, *California, Overdraft, Hydrogeology, Aquifer characteristics, Water levels, Groundwater movement, Salinity, Water quality, Chemical analysis, Monitoring, Sites, Aerial photography, San Antonio Creek valley(CA), Santa Barbara County(CA), Barca Slough(CA).

A nearly threefold increase in demand for water in the 154-square-mile San Antonio Creek valley in California during the period 1958-77 has increased the potential for overdraft on the ground-water basin. The hydrologic budget for this period showed a perennial yield of about 9,800 acre-feet per year and an annual ground-water discharge of about 11,400 acre-feet per year, comprising net

pumpage of 7,100 acre-feet, phreatophyte evapotranspiration of 3,000 acre-feet, and base streamflow of 1,300 acre-feet. The base flow in San Antonio Creek could diminish to zero when net pumpage reaches 13,500 acre-feet per year. The environmentally sensitive marshland area of Barka Slough may then become stressed as water normally lost through evapotranspiration is captured by pumpage. The aquifer consists of alluvial valley fill that ranges in thickness from 0 to 3,500 feet. Ground water moves seaward from recharge areas along mountain fronts to a consolidated rock barrier about 5 miles east of the Pacific coast. Upwelling of ground water just east of the barrier has resulted in the 550-acre Barka Slough. Transmissivity of the aquifer ranges from 2,600 to 34,000 feet squared per day, with the lowest values occurring in the central part of the valley where the aquifer is thickest but probably finer grained. The salinity problems are increasing in the agricultural parts of the valley, which is east of the barrier. West of the barrier, stream and ground-water quality is poor, owing to seepage of saline water from the marine shale that underlies the area at shallow depths. A proposed basinwide monitoring program includes 17 water-level sites, 12 water-quality sampling sites, 3 streamflow measuring sites, and periodic infrared aerial photography of Barka Slough. A computer model of the ground-water flow system could be developed to assess the impact of various water-management alternatives. (USGS)

PUBLIC ATTITUDES OF NEBRASKANS TOWARD WATER POLICY,
Nebraska Univ.-Lincoln, Dept. of Political Science.
S. Welch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198418. Price codes: A02 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska Completion Report, March, 1981. 12 p, 7 Tab, 15 Ref. OWRT-A-058-NEB(1), 14-34-0001-9029.

Descriptors: *Nebraska, *Water policy, *Public opinion, *Policy making, Attitudes, Evaluation, Benefits, Political aspects, Administrative decisions, Public policy, Water law, Legal aspects, Social participation, Public participation, Political constraints, Water use, Water use efficiency, Water shortage, Administrative regulations, Regulations, Water deficit.

The project purposes were to ascertain the extent of public knowledge concerning Nebraska water policy and existing institutions dealing with Nebraska water policy (Natural Resource Districts (NRD'S)); to obtain detailed information on Nebraskan attitudes concerning suggested alternative groundwater policies; to identify groups of Nebraskans in favor of and opposed to several different types of water policy; and to communicate public setiments of this important issue to Nebraska State policy makers. The project used 1977-1980 collected data from the Nebraska Annual Social Indicators Survey (NASIS) by the Bureau of Sociological Research (at University of Nebraska-Lincoln). This is a Statewide survey of 1800 adult Nebraskans. It was concluded that: (1) Nebraskans support water usage control in water shortages, covering agriculture, business, industry, and household use; (2) government regulation, rather than higher prices or taxation, is favored for water usage control; and (3) most Nebraskans are unfamiliar with NRD's and have not participated in NRD elections. The project findings were forwarded to local and State water policy makers. (Zielinski-IPA)

CALIFORNIA'S WATER CONFLICT: NORTH VS SOUTH,
V. Kayfetz.
Ambio, Vol 9, No 6, p 319-320, 1980. 1 Fig.

Descriptors: *California, *Legislation, *Peripheral Canal, *Water rights, Water transfer, Proposition 8, Canals, Legal aspects, State Water Project, California Aqueduct, Deltas, Aqueducts, Environmental effects, Aquatic life, Water law, Water policy.

Opposition to the construction of the Peripheral Canal in the delta area 50 miles east of San Francisco is aimed at repealing the California Senate Bill 200, which authorizes a 20-year $5 billion expansion of the State Water Project, designed to move more northern water to the southern part of the state. Environmentalists are afraid that the 1000 sq mile delta will become unusable for wildlife and agriculture. Salinity problems may occur if insufficient water is allowed to flow to the Pacific. Supporters of the Canal say that water release into the eastern delta will prevent saline intrusion and restore aquatic life. Although Proposition 8 was designed to calm the northerner's fears, many suspect that the few remaining wild rivers may be tapped for consumption in the south. (Cassar-FRC)

THE POLITICS OF WATER POLLUTION CONTROL: A CASE STUDY OF THE FORMATION OF THE CANADA WATER ACT, PART I: COMPREHENSIVE WATER RESOURCE MANAGEMENT: PART II: NUTRIENT CONTROL,
King Alfred's Coll., Winchester (England).
J. W. Parlour.
Journal of Environmental Management, Vol 12, No 1, p 31-64, January, 1981. 1 Fig, 87 Ref.

Descriptors: *Water policy, *Canada Water Act, *Phosphates, Detergents, Nutrients, Legislation, Water law, Political aspects, Nitrilotriacetic acid, Legal aspects, Water resources, Governments, Social aspects, Water quality control, Regulations, Economics, Cost-benefit analysis, Environmental effects, Planning, Political constraints, *Water management, *Nutrient removal.

The 'inside' political aspects of the formation of the Canada Water Act are presented as a complement to earlier studies on the subject of sociopolitical responses to water pollution problems in Canada, 1945-1972. Part I of the paper concerns the formation of the Canada Water Act, Parts I and II, dealing with Comprehensive Water Resources Management and Water Quality Management, respectively. Part II of the paper concerns nutrient control, which is Part III of the Act. After years of preliminary development, during which policy changed from emphasis on water resources management alone to a concern for both water resources and water quality, the Canada Water Act was passed in 1970. Nutrient control was added later as a response to escalation of mass media attention and public concern. A step-by-step description of policies regulating phosphates in detergents is described, as well as the debate on a phosphate substitute, nitrilotriacetic acid, whose long-term health effects are not known. The author states that government scientists promoted policy which complied with their own research findings on eutrophication and phosphate/nitrilotriacetic acid research and suppressed information disagreeing with their views. Although the scientific information was an important factor in formulating policy, final regualtions were set with main concern for public and manufacturer acceptance. The government attempts to weigh costs and benefits of alternative ideas were unreliable and did not sufficiently consider social and economic factors. (Cassar-FRC)

ESTIMATING FLOOD DAMAGES IN THE STATE OF GEORGIA,
Georgia Inst. of Tech., Atlanta. Coll. of Architecture.
T. N. Debo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198343, Price codes: A11 in paper copy, A01 in microfiche. Completion Report, January, 1981. Environmental Resources Center, Georgia Institute of Technology Report ERC 01-81. 213 p, 18 Fig, 17 Tab, 22 Ref, 3 Append. OWRT-A-081-GA(1).

Descriptors: *Flood damage, *Flood date, *Georgia, *Computer models, *Economic impact, Economic prediction, Drainage area, Damage, Floodproofing, Flood plain management, Floods, Floodwater, Flood frequency, Flooding, Model studies, Mathematical models, Model testing, Statistical models, Economic evaluation, Prediction.

This study sought to: document monetary Georgia flood damages; develop a computer model to estimate urban flood damages, for large/small areas throughout Georgia; develop urban flood estimation curves using the computer model, to estimate flood damages quickly for different flood plain developments; study flooding history in six selected case study urban areas and estimate existing and potential average annual expected area flood damages, using the estimation curves; and evaluate Georgia flood damage potential from the case studies and documented information. The economic computer model developed for the Columbus, Georgia, Storm Water Management Program was further refined for this study. Provided that sufficient data are available, the model can be used for estimating flood damages from any land use, using local stage-frequency data. There is very little reliable data documenting monetary damages related to different Georgia flood events; recommendations were developed to address this deficiency, which severely limits studies into flood damage aspects of storm water management. LONG-TERM CONSEQUENCES OF UPSTREAM IMPOUNDMENT,
G. E. Petts.
Environmental Conservation, Vol 7, No 4, p 325-332, Winter, 1980. 4 Fig, 31 Ref.

Descriptors: *Impoundments, *Dams, *Environmental effects, *Invertebrates, *Aquatic life, Upstream, Planning, Environmental effects, Channel morphology, Reservoirs, Erosion, Aquatic habitats, Fish, Construction, Flood control, Sedimentation, Deposition(Sediments), Rivers, Planning, Ecology.

The environmental consequences of dam and reservoir construction on a river system are considered in a framework consisting of first-, second-, and third-order impacts. The immediate and simultaneous effects of the activity (dam building) are first-order impacts, for example, reductions in peak flow, entrapment of sediment load, reduction in suspended sediment load, induced erosion immediately below the dam, and channel changes. These induce second-order impacts, changes in channels and invertebrate populations taking place over a longer period after construction--perhaps as long as 50 years. Channel cross-sectional reduction dominates morphological changes in impounded rivers--depth increase from erosion, depth decrease from sedimentation, width reduction from redistribution of the floodplain and channel boundary materials, and width reduction from sediment deposition. After initial changes in aquatic life during the second-order stage, further adjustments occur as part of a third-order impact. For example, accumulation of fine sediments in pools discourages growth of invertebrates and encourages establishment of rooted aquatic plants. These plants in turn can further affect channel morphology. Changes in

fish habitats, intimately associated with changes in channel width, depth, and sediment composition and in flora and fauna, may continue to occur for many years after the initial construction. Planners should not base environmental impact assessments on short-term effects alone, but must consider the complex interactions taking place over many years before a morphological and ecological equilibrium is reached. EPA Report 600/9-80-033, July, 1980. p 1-8, 1 Fig, 11 Ref.

Descriptors: *Water quality, *Data acquisition, *Research priorities, Pollutants, Automation, Hydrology, Model studies, Model testing, *Water chemistry.

Currently the basic task of hydrochemical research is the development of prognostic and functional models of water quality, which must correspond to the requirement sof operational evaluation and quality control. To obtain the necessary data with the minimum of cost requires estimation of the space and time study level of each component given the existing parameters of the observation system; finding the mean level of study; finding the variation in the level of study with the space-time scanning step; and redistribution of the equipment of the observation network, in order to achieve a space-time level of study of each component agreeing with its weighted significance. The conduct of studies is the most important of the stages of model development, with the aim of using equipment efficiently to collect a large quantity of data. Automated measurements in situ can greatly increase the effectiveness of observation and measurement of pollutants. It is suggested that reference points be created for the performance of studies in priority regions, from which methodologic and technical guidance could be provided. (Brambley-SRC)

MODELING THE GREAT LAKES - A HISTORY OF ACHIEVEMENT,
Great Lakes Basin Commission, Ann Arbor, MI.
W. C. Sonzogni, and T. M. Heidtke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980. p 9-36, 3 Tab, 98 Ref.

Descriptors: *Model studies, *Great Lakes, *Water quality, *Water circulation, Heated water, Poisons, Nonpoint pollution sources, Management planning, Eutrophication, Water quality, Phosphorus, Research priorities.

In an attempt to supplement and update other Great Lakes modeling reviews and to identify areas of relative strength and weakness in using current modeling technology to assist in the study of specific Great Lakes problems, over 100 models were identified in a literature survey. The models can be categorized into water quality; circulation/transport; heated effluent dispersion; toxic substances; nonpoint source; and other models. Most of the models are in the first two categories. The greatest constraint on the use of the models is the inherent difficulty associated with model verification. However, they are of great value in real planning situations, such as eutrophication in Lakes Erie and Ontario, policy and resource management decision making, and the formulation of desirable phosphorus loads or inputs into the lakes given different conditions of lake water quality. Future modeling efforts should be directed toward toxic chemicals, the nearshore area, and developing models which can be used practically to arrive at management decisions. (Brambley-SRC)

OPTIMAL SAMPLING FOR LONG TERM TRENDS IN LAKE HURON,
Environmental Research Lab.-Duluth, Grosse Ile, MI. Large Lakes Research Station.
D. M. Dolan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980, p 58-70. 2 Fig, 5 Tab, 21 Ref.

Descriptors: *Model studies, Water sampling, *Cost analysis, Tributaries, *Water pollution sources, Nutrients, Radioisotopes, Heavy metals, Suspended solids, Great Lakes, *Lake Huron.

The Lake Huron Surveillance Plan calls for intensive sampling of the main lake in 1980, 1989, and 1998, and sampling of the major tributaries each year, so that long term changes may be detected. There is a trade-off between accuracy and funds required so a method is required to optimize the sampling program to obtain the necessary accuracy at minimum cost. A dynamic mass balance model is to be used with the Kalman filter to provide estimates of lake concentrations. Three types of measurement can be made: sampling of the open lake; tributary and point source sampling; and all field and laboratory measurements that improve the accuracy of the mass balance model. For nutrients, the northern segment of the lake is oversampled, while the southern segment is undersampled. This situation can be improved by increasing the number of stations in the southern segment, or by improving the model to be used with the Kalman filter to obtain estimates of trends. These results are probably generalizable to other parameters that could be described well by a simple mass balance, such as conservative substances, radionuclides, some heavy metals, and suspended solids. Biological parameters and certain organic contaminants would require a more sophisticated approach. (Brambley-SRC)

SNOWPACK MONITORING IN NORTH AMERICA AND EURASIA USING PASSIVE MICROWAVE SATELLITE DATA,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
J. L. Foster, A. Rango, D. K. Hall, A. T. C. Chang, and L. J. Allison.
Remote Sensing of Environment, Vol 10, No 4, p 285-298, 1980. 11 Fig, 8 Ref.

Descriptors: *Satellites(Artificial), *Snow surveys, Monitoring, *Remote sensing, Microwaves, Data collection, Snowpacks, Snow cover, North America, Eurasia.

Passive microwave data from satellite monitoring was correlated with snow depth in four study areas--the Canadian high plains, Montana and North Dakota high plains, and the steppes of central Russia. Each area is relatively flat and homogeneous. Microwave brightness temperature correlated with snow depth within each area, but relationships could not be applied to another area because factors such as snow water equivalent, density, liquid water within the pack, grain and crystal sizes, ground cover, soil conditions, and surface temperatures affect the brightness temperature. Nimbus-6 (0.81 cm wave length) ESMR data produced higher correlations than Nimbus-5 (1.55 cm wave length) ESMR data. Qualitative monitoring of snow pack buildup and disappearance in a given area by this method appears feasible. (Cassar-FRC)

W81-02671

WATER RESOURCES DATA FOR CALIFORNIA, WATER YEAR 1979--VOLUME 2. PACIFIC SLOPE BASINS FROM ARROYO GRANDE TO OREGON STATE LINE EXCEPT CENTRAL VALLEY.
Geological Survey, Menlo Park, CA. Water Resources Div.
Geological Survey Water-Data Report CA-79-2, January 1981. 509 p, 3 Fig.

Descriptors: *California, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Pacific slope basins.

Volume 2 of water resources data for the 1979 water year for northeastern California consists of records of stage, discharge, and water quality of streams and wells; stage, contents, and water quality in lakes and reservoirs; and water levels in wells. This report contains discharge records for 155 gaging stations, stage and contents for 20 lakes and reservoirs, water quality for 131 stations and 17 wells, and water levels for 85 observation wells. Also included are 8 crest-stage partial-record stations and 8 low-flow partial-record stations. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in California. (USGS)
W81-02672

WATER RESOURCES DATA FOR CALIFORNIA, WATER YEAR 1979--VOLUME 3. SOUTHERN CENTRAL VALLEY BASINS AND THE GREAT BASIN FROM WALKER RIVER TO TRUCKEE RIVER.
Geological Survey, Menlo Park, CA. Water Resources Div.
Geological Survey Water-Data Report CA-79-3, January 1981. 417 p, 12 Fig.

Descriptors: *California, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Great Basin, Walker River(CA), Truckee River(CA), Southern central valley basins(CA).

Volume 3 of water resources data for the 1979 water year for central California consists of records of stage, discharge, gage-height, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 182 gaging stations, stage and contents for 40 lakes and reservoirs, gage-height records for 2 lakes, water quality for 55 stations, water levels for 44 observation wells, and water quality for 4 wells. Also included are 11 crest-stage partial-record stations and 4 water-quality partial-record stations. Additional water data were collected which are not part of the systematic data-collection program. It is published as a special investigation. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in California. (USGS)
W81-02673

WATER RESOURCES DATA FOR LOUISIANA, WATER YEAR 1980--VOLUME 2. SOUTHERN LOUISIANA.
Geological Survey, Baton Rouge, LA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-186033, Price codes: A17 in paper copy, A01 in microfiche. Geological Survey Water-Data Report LA-80-2, 1980. 371 p, 15 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Louisiana, *Southern Louisiana.

Water resources data for the 1980 water year for Louisiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground water. This report, in three volumes, contains records for water discharge at 75 gaging stations (including stage for 71 of these stations); stage only for 38 gaging stations and 11 lakes; contents for 1 reservoir; water quality for 124 surface-water stations (including 34 gaging stations), 107 miscellaneous sites, 15 lakes, and 268 wells; and water levels for 506 observation wells. Also included are data for 271 crest-stage and flood-profile partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States are also included in this report. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Louisiana. (USGS)
W81-02674

GROUND-WATER QUALITY AND DATA ON WELLS AND SPRINGS IN PENNSYLVANIA, VOLUME I--OHIO AND ST. LAWRENCE RIVER BASINS,
Geological Survey, Harrisburg, PA. Water Resources Div.
H. E. Koester, and D. R. Miller.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $12.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1119, November 1980. 95 p, 15 Fig, 15 Tab, 2 Ref.

Descriptors: *Groundwater, *Water quality, Hydrologic data, Water wells, *Well data, *Pennsylvania, Springs, Aquifers, Water levels, Elevation, Water yield, Geohydrologic units, Sites, Chemical analysis, Trace elements, *Ohio River basin(PA), *St. Lawrence River basin.

Volume I of the Groundwater Quality and Data on Wells and Springs in Pennsylvania presents groundwater quality and physical data on about 1,200 well and spring sites in the Ohio and St. Lawrence River basins. Locations are shown on site-location maps derived from the hydrologic unit map. Codes showing the geologic age and aquifer are provided. (USGS)
W81-02675

STREAMFLOW STATISTICAL SUMMARIES FOR COLORADO STREAMS THROUGH SEPTEMBER 30, 1975, VOLUME 2: COLORADO RIVER BASIN ABOVE GUNNISON RIVER,
Geological Survey, Lakewood, CO. Water Resources Div.
H. E. Petsch, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $46.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 79-1060, 1980. 350 p, 3 Fig, 2 Tab, 15 Ref.

Descriptors: *Hydrologic data, *Streamflow, Streams, *Colorado, *Gaging stations, Surface waters, Flow duration, Discharge(Water), High flow, Low flow, Flow characteristics, Statistics, Annual, Monthly, Data collections, *Colorado River basin(CO).

Statistical summaries of daily streamflow data for 189 stations west of the Continental Divide in Colorado are presented in this report. Duration tables, high-flow sequence tables, and low-flow sequence tables provide information about daily mean discharge. The mean, variance, standard deviation, skewness, and coefficient of variation are provided for monthly and annual flows. Percentages of average flow are provided for monthly flows and first-order serial-correlation coefficients are provided for annual flows. The text explain the nature and derivation of the data and illustrates applications of the tabulated information by examples. The data may be used by agencies and individuals engaged in water studies. (USGS)
W81-02676

SELECTED CHEMICAL QUALITY CHARACTERISTICS IN STREAMS OF KENTUCKY, 1970-75.
Geological Survey, Louisville, KY. Water Resources Div.

W81-02680

MEASUREMENTS OF DISCHARGE, GAIN OR LOSS IN FLOW, AND CHEMICAL QUALITY OF THE POPLAR AND REDWATER RIVERS, NORTHEASTERN MONTANA, OCTOBER 24-25, 1979,
Geological Survey, Helena, MT. Water Resources Div.
K. A. Dodge, and G. W. Levings.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $2.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1210, November 1980. 16 p, 2 Fig, 3 Tab.

Descriptors: *Discharge measurement, Flow measurement, *Water quality, *Streams, *Montana, Flow rates, *Streamflow, Base flow, Specific conductivity, Water temperature, Surface-groundwater relationships, Data collections, Sampling, Sites, Chemical analysis, *Poplar River(MT), *Redwater River(MT).

Discharge, specific conductance, and water temperature were measured at 37 sites on the Poplar and Redwater Rivers in northeastern Montana on October 24-25, 1979, to provide data on the interaction between surface-water and groundwater systems. Streamflow gains or losses were computed for those stream reaches not significantly affected by irrigation. Water samples were collected at 17 of the sites for detailed chemical-quality analysis. The tabulated data provide an areally broad data base of concurrent base-flow conditions. (USGS)

HYDROLOGIC AND CLIMATOLOGIC DATA, SOUTHEASTERN UINTA BASIN, UTAH, AND COLORADO, WATER YEAR 1978,
Geological Survey, Salt Lake City, UT. Water Resources Div.
L. S. Conroy.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $21.25 in paper copy, $5.50 in microfiche. Geological Survey Open-File Report 80-1025, 1980. 166 p, 6 Fig, 8 Tab, 2 Ref.

Descriptors: *Hydrologic data, *Climatic data, *Colorado River basin, *Utah, *Colorado, Available water, Surface waters, Groundwater, Water quality, Precipitation(Atmospheric), Snow surveys, Streamflow, Flow rates, Water wells, Water yield, Water levels, Temperature, Specific conductivity, Water analysis, Chemical analysis, Southeastern Unita basin.

This report contains data collected in the vicinity of the oil-shale area in the southeastern Uinta Basin, Utah and Colorado, from Oct. 1, 1977, to Sept. 30, 1978. The data presented in tables, include monthly precipitation, depth-duration of rainfall, snow depth and water content, air temperature, daily streamflow records, water-quality data from continuous-recording gaging sites, water-quality data for wells and springs, and water levels, temperature, and specific conductance for selected wells. (USGS)
W81-02694

SUMMARY OF HYDROLOGIC DATA FOR THE EAST EVERGLADES, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. J. Schneider, and B. G. Waller.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $10.75, in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1292, 1980. 73 p, 56 Fig, 3 Tab, 4 Ref.

Descriptors: *Hydrologic data, *Swamps, *Rainfall, *Community development, *Florida, Water control, Discharge(Water), Water levels, Water table, Duration curves, Hydrographs, Water management(Applied), Everglades, *Dade County(FL).

The East Everglades area in south-central Dade County, Fla., occupies approximately 240 square miles. The area is flat and low lying with elevations ranging from sea level in the southeast part to 10 feet at Chekika Hammock with an average elevation of about 6 feet. Rainfall in the area averages 57.9 inches a year with about 80% of the total falling during the May to October wet season. There is some residential development and farming in the east-central part of the area where land elevations are slightly higher. Pressure by agricultural, commerical, and housing interests to develop the area is increasing. Historically, most of the area was flooded for extended periods of time. The construction of canals, levees, and controls has lowered the average water levels of the area. This has reduced the extent and decreased the time of flooding. Long-term hydrographs show graphically the effects that the water control works have had on the hydrologic system. The change in discharge into the north end of the East Everglades through the Tamiami Canal outlets, Levees 30 to 67A, due to construction is very pronounced. Maps showing the altitude of the water table for wet and dry periods indicate that Levee 67 Extended Canal greatly influences the water levels and shape of the water-table contours in the northwestern part of the East Everglades. (USGS)
W81-02697

WATER RESOURCES DATA FOR NEVADA, WATER YEAR 1979.
Geological Survey, Carson City, NV. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-188740, Price codes: A17 in paper copy, A01 in microfiche. Geological Survey Water-Data Report NV-79-1, November, 1980. 388 p, 9 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical anal-

ysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Nevada.

Water resources data for the 1979 water year for Nevada consist of records of discharge and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 128 gaging stations; stage and contents for 20 lakes and reservoirs; water-quality data for continuing-record stations at 27 stream sites and 1 lake site and for partial-record stations at 71 stream sites, 3 lake sites, 8 wells, and 1 spring; and water levels for 208 observation wells. Also included are 78 crest-stage partial-record stations and 13 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Nevada. (USGS)
W81-02698

HYDROLOGIC MAPS AND DATA FOR SANTA FE COUNTY, NEW MEXICO,
Geological Survey, Albuquerque, NM. Water Resources Div.
W. A. Mourant.
New Mexico State Engineer Basic Data Report, 1980. 180 p, 4 Fig, 3 Tab.

Descriptors: *Groundwater resources, *Hydrologic data, *Maps, *New Mexico, *Data collections, Water wells, Water levels, Contours, Springs, Sites, Specific conductivity, Chemical analysis, *Santa Fe County.

This report contains hydrologic and geologic data that will be useful in future quantitative studies of the water resources of Santa Fe County, N.Mex. It lists well and spring data, including well locations, water levels, and chemical analyses of well and spring water. Illustrations in the report include maps showing locations of wells and springs with water-level contours, and specific conductance of well and spring water. (USGS)

WATER RESOURCES DATA FOR ALABAMA, WATER YEAR 1979--VOLUME 1. APALACHICOLA, CHOCTAWATCHEE, BLACKWATER, ESCAMBIA, PERDIDO, AND ALABAMA RIVER BASINS.
Geological Survey, University, AL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-179632, Price codes: A11 in paper copy, A01 in microfiche. Geological Survey Water-Data Report AL-79-1, October, 1980. 231 p, 7 Fig, 1 Tab.

Descriptors: *Alabama, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, Appalachicola River basin, Choctawhatchee River basin, Blackwater River basin, Escambia River basin, Perdido River basin, Alabama River basin, Mobile River basin.

Water resources data for the 1979 water year for Alabama consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels in wells. This report, in two volumes, contains discharge records for 99 gaging stations, stage only for 23 gaging stations, stage and contents for 12 lakes and reservoirs, water quality for 71 gaging stations, and water levels for 53 observation wells. Also included are 24 low-flow partial-record stations, 20 crest-stage partial-record stations, 11 flood hydrograph partial-record stations, and 112 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alabama. (USGS)

DATA MANAGEMENT REQUIREMENTS FOR GREAT LAKES WATER QUALITY MODELING,
Environmental Research Lab.-Duluth, Grosse Ile, MI. Large Lakes Research Station.
W. L. Richardson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980, p 37-57. 8 Fig, 3 Tab, 13 Ref, 3 Append.

Descriptors: *Great Lakes, *Water quality, *Model studies, Data collections, *Data storage and retrieval, Data processing, Information systems, Information exchange, Water quality management, Lakes, Eutrophication, Costs.

Efficient data management is essential to water quality managment and research programs, requiring adequate staff and budget provisions for its implementation, regardless of the purpose to which the data are being applied. For the Great Lakes, water quality information is maintained in the STORET on-line data base system. It contains data collected by the U.S. participants in the Great Lakes Surveillance Plan, and all the open lake data collected by the Canadian Center for Inland Waters. The amount of information for the years prior to and including 1960, and 1961-1979 is given for each lake and the connecting channels, and a summary of Great Lakes eutrophication data is presented. Accurate and timely data processing plays a key role in the modeling process, subject to proper surveillance design. It is suggested that about 10% of total project costs be devoted to data management. (Brambley-SRC)

PRINCIPLE OF ORGANIZATION OF AN AUTOMATED INFORMATION SYSTEM,
Gidrokhimicheskii Inst., Rostov-na-Donu (USSR).
V. L. Pavelko.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118374, Price codes: A18 in paper copy, A01 in microfiche. In: Proceedings of the Second American-Soviet Symposium on the Use of Mathematical Models to Optimize Water Quality Management, August 27-30, 1979, Bloomfield Hills, MI. EPA Report 600/9-80-033, July, 1980. p 197-206, 1 Fig, 2 Ref.

Descriptors: *Data collections, *Information systems, *Computers, *Water quality, *Ecological effects, Water pollution, Hydrologic data, Hydrobiology, Water chemistry, Monitoring, Data storage and retrieval.

A major problem of testing and control of the environment is the creation of an automated information system (AIS) for water quality as a section of a more general ecologic information system. The flow of information determines the external conditions of existence of the processes which we are studying. These, in turn, define the function of the source of a pollutant and are a response to the condition of water objects, and will be referred to as accompanying flows. These flows of information are related to hydrochemical subjects as follows: external conditions, such as hydrologic flow, meteorology, and hydrobiologic data; source function, such as data on waste waters, pollution of the atmosphere and soil, hydrogeologic data, sedimentation, burial of pollutants, and hydrobiologic characteristics; and response, such as sanitary-hygienic data, hydrobiologic data, ichthyologic data, industrial water use, and marine hydrochemistry. The principles which were used in the creation of the AIS-hydrochemistry system are summarized. Included are some of the results obtained, which are recommended as principles for the creation of a global monitoring AIS, which is expected will ultimately include all nations. (Moore-SRC)

8A. Structures

SAFETY EVALUATION OF EXISTING DAMS, A MANUAL FOR THE SAFETY EVALUATION OF EMBANKMENT AND CONCRETE DAMS.
Water and Power Resources Service, Denver, CO. Water Resources Technical Publication, 1980. 164 p, 2 Fig, 33 Ref, 3 Append.

Descriptors: Concrete dams, Earth dams, Rockfill dams, *Dams, *Safety, *Inspection, Embankments, Hydraulic structures, Dam failure, Dam design, Dam stability, On-site investigations, Dam construction, *Dam stability, Evaluation.

The purpose of the SEED (Safety Evaluation of Existing Dams) Program is to comprehensively review the design, construction, and performance history of all Water and Power Resources Service dams, to evaluate their structural and hydraulic integrity, and to determine any need for remedial actions. This manual is intended to provide engineering and technical personnel at all levels of

government (Federal, State, and local) and private engineering organizations with sound, comprehensive guidelines and procedures for the inspection and evaluation of public and private dams. The manual sets forth guidelines for: scope and frequency of evaluations; team selection and responsibilities; preparing and updating Data Books; evaluating design, construction, and operations; making field examinations; developing conclusions and recommendations; and preparing reports. The design of the dam and appurtenant structures should be reviewed to assess the actual performance compared to the intended performance. Engineering data and records originating during the construction period should be reviewed to determine if the structures were constructed as designed. A field examination and review of available instrumentation records also should be made to assess the actual performance of the structures. Sample field examination checklists are provided for both embankment dams and concrete dams. (Moore-SRC)

ALGORITHMS FOR PIPE NETWORK ANALYSIS AND THEIR RELIABILITY,
Kentucky Water Resources Research Inst., Lexington.
D. J. Wood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-193971, Price codes: A05 in paper copy, A01 in microfiche. Research Report No 127, March 1981. 108 p, 6 Fig, 21 Tab, 19 Ref. OWRT-B-060-KY(1), 14-34-0001-9114.

Descriptors: *Water distribution, *Pipe flow, Pipelines, Networks, *Steady flow, Pumps, Pipe network, *Algorithms, Convergence, Pipe network analysis.

Algorithms for analyzing steady state flow conditions in pipe networks are developed for general applications. The algorithms are based on both equations expressed in terms of unknown flowrates and node equations expressed in terms of unknown grades. Five methods, which represent those in significant use today, are presented. An example pipe network is analyzed to illustrate the application of the various algorithms. The various assumptions required for the different methods are presented and the methods are compared within a common framework. The reliabilities of these commonly employed algorithms for pipe network analysis are investigated by analyzing a large number of pipe networks using each of the algorithms. Numerous convergence and reliability problems are documented. It is shown that two methods based on loop equations have superior convergence characteristics. Methods based on node equations are less reliable and these methods are often unable to adequately handle low resistance lines. A discussion of convergence criteria and solution reliability is presented for the various algorithms. The results presented in this report will allow engineers to accurately carry out pipe network analysis.
W81-02658

APPLICATION OF WIND ENERGY TO GREAT PLAINS IRRIGATION PUMPING,
Science and Education Administration, Manhattan, KS. North Central Region.
L. J. Hagen, L. Lyles, and E. L. Skidmore.
Advances in Agricultural Technology AAT-NC-4, January 1980. 24 p, 23 Fig, 7 Tab, 27 Ref.

Descriptors: *Pumping, *Irrigation efficiency, *Wind energy, *Irrigation wells, Wind velocity, Sprinkler irrigation, Computer programs, Irrigation requirements, Economic efficiency, Well yield, Fuel, Nebraska, Kansas, Texas, Wheat, Corn, Case studies.

A computer program was developed to simulate operation of wind-powered irrigation wells. Pumping by wind turbine systems was simulated for two variable and two constant flow operational modes in which auxiliary motors were used in three of the modes. A comparison was made among the four modes of well yields and maximum pumping rates as a function of drawdown in a typical well. The program also was used to determine monthly well yields using a 250 sq m swept area wind turbine system in each mode if located at Columbus, Nebraska, Garden City, Kansas and Amarillo, Texas. The percentage of fossil fuel replaceable by wind energy was calculated for the most efficient constant and variable flow modes. Wind powered systems could supply half or more of the Great Plains irrigation energy demand using the present mix of sprinkler and surface distribution systems. Proper irrigation management is important to maximize wind energy use. Fully irrigated summer crops with preplant irrigation will use 30 to 60% of the annual, capturable wind energy, depending on crop and location. Fully irrigated equal areas of corn and winter wheat will use 70 to 85% of the wind energy, depending on location. With limited irrigation, 50 to 100% of the wind energy can be used, depending on practices followed. (Moore-SRC)

A SOLAR HEATED FISH HATCHERY WATER RECYCLING SYSTEM,
Sea Run, Inc., Kennebunkport, ME.
E. S. Sawyer, and P. J. Sawyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-196750, Price codes: A03 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT-RU-81/3, July, 1980. 31 p, 9 Fig, 5 Tab, 12 Ref. OWRT-C-80165-R(No 8811)(1), 14-34-0001-8811.

Descriptors: *Water reuse, *Aquaculture, *Fish hatcheries, *Solar radiation, Biological filters, Chemical treatment, Smolt, Trout, Water consumption, Growth.

The purpose of this project was to rear smolts, young salmonids large enough for seawater entry, in a water recycling hatchery. High reuse was necessary to overcome temperature and groundwater limitations in coastal Maine and New Hampshire. Four rearing units were operated in a partially underground building. Each unit consisted of a 2,000 gallon fish tank and 500 gallon flooded biological filter, and reared 20,000 to 25,000 rainbow trout to smolt size (4 inches). Water consumption averaged 10 gallon/day/unit compared to 57,000 gallon/day/unit in a flow-through hatchery. Solar heating of water to accelerate fish growth resulted in shortening production time for a 4 inch fish from 18 months to 6 months. Costs/unit were approximately the same as those of a flow-through hatchery that must pump water, and considerably less than a flow-through hatchery that must heat water.

THE WRRI TROUT COVER RATING METHOD: DEVELOPMENT AND APPLICATION,
Wyoming Univ., Laramie. Water Resources Research Inst.
T. A. Wesche.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198368, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Series No 78, December, 1980. 46 p, 9 Fig, 5 Tab, 9 Ref, Append. OWRT B-032-WYO(2), 14-34-0001-6135.

Descriptors: Brown trout, Brook trout, Colorado River cutthroat trout, *Trout, Water depth, Flow rates, Streams, Surveys, *Instream flow, *Trout habitat, *Trout cover, Environmental effects.

Trout cover can generally be described as object-oriented, having a water depth of at least 0.5 feet, a point water velocity of less than 0.5 feet per second, and a mean water velocity of less than 1.0 feet per second. Brown trout were found to be more cover-oriented than are brook or Colorado River cutthroat trout. A significant positive relationship was found to exist between the amount of cover available and the standing crops of brown trout. For measuring available cover in smaller streams (average discharge less than 100 cfs), the basic WRRI Cover Rating (WCR) Method is recommended. For larger streams, the modified WCR Method (including a 'deep-water' factor) is best suited. Step-by-step instructions for the use of both methods are presented in the Appendix.
W81-02717

TEMPERATURE-CONTROLLED RECIRCULATING SYSTEM FOR HATCHING CATOSTOMID LARVAE,
Purdue Univ., Lafayette, IN. Dept. of Forestry and Natural Resources.
K. D. Curry, and A. Spacie.
The Progressive Fish-Culturist, Vol 42, No 3, p 151-152, July, 1980. 1 Fig, 4 Ref. OWRT A-052-IND(3).

Descriptors: *Temperature control, *Fish hatcheries, Fish eggs, Suckers, Catostomid, Larvae, *Fish hatching system.

A brief note describes a temperature-controlled recirculating fish hatching system. The principal parts of the unit are refrigeration unit, submersible pumps, the aquaria and floating egg cups. The system enables tempeature control between 2 and 21C. Water temperature can easily be adjusted to match stream temperatures prevailing where fish eggs are collected and fertilized.

AQUACULTURE: CATFISH AND TROUT, INVENTORY AND SALES, 1980.
Economics and Statistics Service, Washington, DC. Crop Reporting Board.
Statistical Bulletin 644, October 1980. 12 p, 15 Tab.

Descriptors: *Fish farming, *Trout, *Surveys, *Catfish farming, Fish harvest, Water use, *Aquaculture, Water supply, Water requirements, Economic evaluation.

Selected state estimates of catfish and trout inventories as of August 1, 1980, and sales from January 1 through July 31 were prepared from a survey conducted in late August. A probability sample of about 1,330 was selected from a list of all known commercial producers and an area frame sample was used to estimate for producers not on the list. Catfish were produced in 10 states, in which 43.4 million pounds were sold with a value of $33.8 million. Producers were using 56,200 acres of water surface and reported intentions to expand operations by 16,100 acres during 1981. The primary source of water supply was from wells followed by rain and/or watershed. Trout growers in 9 selected states sold 28.5 million pounds of trout valued at $24.6 million. Producers planned to extend the current utilization of 63.0 million cubic feet by 4.16 million cubic feet in 1981. The primary water source was springs followed by wells. (Brambley-SRC)

AQUACULTURE: OPPORTUNITIES FOR AN EXPANDED INDUSTRY IN ILLINOIS,
Illinois Natural History Survey, Urbana.
R. W. Gordon, and R. E. Westgren.
Illinois Institute of Natural Resources, Chicago. Document No 80/18, December, 1980. 118 p, 4 Fig, 28 Tab, 56 Ref, 3 Append.

Descriptors: *Illinois, *Aquaculture, *Catfish ponds, *Fish farming, *Commercial fishing, Fish ponds, Catfish, Carp, Trout, Eel, Frogs, Plankton, Algae harvesting, Animal diseases, Strip mine lakes.

Aquaculture---growing aquatic organisms in freshwater systems---appears practical, feasible, and potentially profitable in Illinois. For example, results of recent studies suggest that good aquaculture businessmen who raise catfish that retail for $2.80/pound may expect annual profits ranging from $625 to $1,250 per hectare. Small operations are less likely to be profitable than larger systems, due

to various fixed costs; catfish ponds of 20-acre size with multiple ponds are recommended. In addition to pond culture, aquaculture systems in raceways, silos, and cages are discussed, and economic estimates are given for trout and perch as well as for catfish. In Illinois, fewer than 200 acres of water are currently used for the culture of commercial catfish. In contrast, Arkansas and Mississippi have more than 25,000 acres of ponds in use for catfish production. Several economic obstacles affect the growth of Illinois's aquaculture industry, such as land costs, taxes, interest costs, and alternative uses for farmland. Other obstacles are lack of knowledge, insufficient marketing and service support for entrepreneurs, and a current lack of support from bankers and agricultural supply firms. The report suggests using other states as models to overcome these obstacles, with the goal of developing an industry that is a viable branch of agriculture in Illinois. (Garrison-Omniplan)

9. MANPOWER, GRANTS AND FACILITIES

9C. Research Facilities

COWEETA HYDROLOGIC LABORATORY, 1934-2034: PAST, PRESENT AND FUTURE,
Southeastern Forest Experiment Station, Franklin, NC. Coweeta Hydrologic Lab.
J. E. Douglass, and D. G. Neary.
In: Proceedings of the Helsinki Symposium, June, 1980. IAHS-AISH Publication No 130, p 61-65. 6 Ref.

Descriptors: *Coweeta Hydrologic Laboratory, North Carolina, *Appalachian Mountain Region, *Forestry, *Hydrology, *Research facilities, Research priorities, Rainfall, Runoff, Water resources, Water yield, Water quality, Models, Water pollution sources, Forest managment, Ecosystems.

The early research at Coweeta Hydrologic Laboratory, North Carolina, emphasized calibration of basins and establishment of rainfall-runoff patterns. Subsequently land use, forest cutting and species conversion were studied to determine their effects on water resources primarily, water yield. Integration of the results of soil, plant, atmospheric and hydrologic studies led to the development of process models for the simulation of streamflow. Current studies emphasize water quality rather than water quantity, focusing on mineral cycling and nonpoint source pollution. Mineral cycling is investigated to understand and assess the consequences of specific forest management practices on terrestrial and aquatic ecosystems and to determine the effects of alternative levels of timber utilization on future productivity of the system. Future projects will continue the trend toward short-term studies relating alternative management practices to water quality. Coweeta will continue to be used for studying basic hydrological processes, for testing improved models and for paired basin studies of hydrological and ecological problems. (Brambley-SRC)

USGS: ITS WATER RESOURCES RESEARCH ACTIVITY,
S. Miller.
Environmental Science and Technology, Vol 15, No 2, p 140-142, February, 1981.

Descriptors: *Research, *Water resources, *United States Geological Survey, *Research facilities, Projects, Hydrology, Model studies, Water pollution, Waste disposal.

The Water Resources Division of the U.S. Geological Survey has 2900 employees, 373 of whom are engaged in research. There are 46 district offices through which the federal-state cooperative programs are implemented. Each of the four regional research centers studies a wide range of hydrologic problems and specializes in certain disciplines. The Gulf Coast Hydroscience Center's area of expertise is mathematical modeling for transfer and fate of organic pollutants in water resources. The Reston, Va., office concentrates on geochemical and groundwater research. The Denver center focuses on sediment research, groundwater transfer, and the fate of pollutants. Biology and geothermal studies are specialties of the Menlo Park, Cal., office. Proposed research programs involve droughts, tidal freshwater streams, lakes, water use data applications, and hydrologic factors associated with volcanic activity. Continuing attention will be given to hazardous waste disposal, acid rain, groundwater contamination, and cold region hydrology. (Cassar-FRC)

10. SCIENTIFIC AND TECHNICAL INFORMATION

10C. Secondary Publication And Distribution

WATER RESOURCES THESAURUS, THIRD EDITION.
Office of Water Research and Technology, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-198376, Price codes: A07 in paper copy, A01 in microfiche. Publication OWRT IT-80/1, 1980. 132 p.

Descriptors: *Thesauri, *Information systems, *Indexing, *Information retrieval, *Water resources, Vocabularies, Computers, Abstracting, On-line retrieval, On-line searching, Libraries, Publications, Research, Technology transfer, Technology.

The third edition of the Water Resources Thesaurus, which represents a major revision of the previous 1971 edition, provides a vocabulary for indexing and retrieving the literature of water resources research and development. The terms in this edition were selected from the more than 105,000 indexing terms used in the 'Selected Water Resources Abstracts'. Some high frequency terms were excluded because they were too broad or ambiguous. Also deleted were the names of specific legislative acts, rivers, oceans, bays, birds, and most chemical terms. Due to changes in retrieval capability, such as text searching, this edition emphasizes terms useful for classifying or grouping specifics because such terms are needed in selecting subsets, but may not appear in the abstract. The Thesaurus has three sections: Thesaurus of Descriptors, Descriptor Words, and Descriptor List. The Thesaurus of Descriptors, the main indexing and retrieval tool, is an alphabetical list of terms interfiled with five types of cross-references: USE, Used For, Broader Term, Narrower Term, and Related Term. Descriptor Words is an alphabetical listing of each significant word comprising a term in the Thesaurus. The Descriptor section contains all approved terms, allowing for quick verification of terms and their spelling. (Seigler-IPA)

Incidence of Marine Bdellovibrios Lytic Against Vibrio Parahaemolyticus in Chesapeake Bay,
W81-02845 5A

Rate of Occurrence of False-Positive Results From Total Coliform Most-Probable-Number Analysis of Shellfish and Estuaries,
W81-02847 2L

CHILE
Some Ecological Observations on Environmental Parameters, Planktonic Seasonal Succession and Biomass in Rio Cruces (Prov. Valdivia), South Chile,
W81-02876 5C

CHLORELLA
The Comparison of Soy-Bean Wastes, Used Tea Leaves and Sewage Sludge for Growing Chlorella Pyrenoidosa,
W81-02861 5D

CHLORINATED HYDROCARBONS
Survey and Control of Synthetic Organics in Texas Water Supplies,
W81-02719 5A

Overland Flow: Removal of Toxic Volatile Organics,
W81-02779 5D

CHLORINATION
Isolation and Identification of an Ames-Mutagenic Compound Present in Kraft Chlorination Effluents,
W81-02875 5A

CHLOROPHYLL
The Inadequacy of Existing Chlorophyll-a/ Phosphorus Concentration Correlations for Assessing Remedial Measures for Hypertrophic Lakes,
W81-02856 5C

Phosphorus, Chlorophyll, and Eutrophic Lakes,
W81-02886 5C

CHROMATOGRAPHY
Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

Chromatographic Enrichment of Acidic Compounds From Organic Solvents Using Alkali Metal Silicates,
W81-02829 5A

CHROMIUM
Fate of Chromium in a Tributary of the Iraja River, Rio De Janeiro,
W81-02865 5B

CISTERNS
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

CLIMATIC DATA
Hydrologic and Climatologic Data, Southeastern Uinta Basin, Utah, and Colorado, Water Year 1978,
W81-02694 7C

CLIMATOLOGY
Preliminary Analysis of Regional-Precipitation Periodicity,
W81-02687 2B

COAGULATION
The Effect of pH on the Coagulation and Purification of Wastewater,
W81-02832 5D

COAL MINING
Environmental Effects of Western Coal Surface Mining, Part VI - Smallmouth Bass and Largemouth Bass in the Tongue River Reservoir, Montana, 1975-76,
W81-02775 5C

COALS
Acid Lakes From Natural and Anthropogenic Causes,
W81-02870 5B

COASTAL MARSHES
Persistence of Spilled Oil in a Texas Salt Marsh,
W81-02857 5B

COASTAL PLAINS
Groundwater Hydrology of James City County, Virginia,
W81-02695 2F

COASTAL STREAMS
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

COASTAL WATERS
Kelp Beds at Saunders Reef, Mendocino County.
W81-02799 5C

San Diego Marine Life Refuge, San Diego County.
W81-02800 5C

Organochlorine Compounds in Mussels From Scottish Coastal Waters,
W81-02858 5A

COLIFORMS
Coliforms and Fecal Streptococcus in the Illinois River at Peoria, 1971-1976,
W81-02792 5B

Rate of Occurrence of False-Positive Results From Total Coliform Most-Probable-Number Analysis of Shellfish and Estuaries,
W81-02847 2L

Yeasts From Marine and Estuarine Waters with Different Levels of Pollution in the State of Rio De Janeiro, Brazil,
W81-02885 5A

COLIPHAGES
Recovery of Coliphages From Waste Water Effluents and Polluted Lake Water by the Magnetite-Organic Flocculation Method,
W81-02852 5A

COLLIER COUNTY (FL)
Water-Resources Investigations, Collier County, Florida,
W81-02699 5G

COLORADO
Streamflow Statistical Summaries for Colorado Streams Through September 30, 1975, Volume 2: Colorado River Basin Above Gunnison River,
W81-02676 7C

Hydrologic and Climatologic Data, Southeastern Uinta Basin, Utah, and Colorado, Water Year 1978,
W81-02694 7C

COLORADO RIVER BASIN
Hydrologic and Climatologic Data, Southeastern Uinta Basin, Utah, and Colorado, Water Year 1978,
W81-02694 7C

Chemical and Mineralogical Composition and Behavior of the Mancos Shale as a Diffuse Source of Salts in the Upper Colorado River Basin,
W81-02711 5B

COLORADO RIVER BASIN (CO)
Streamflow Statistical Summaries for Colorado Streams Through September 30, 1975, Volume 2: Colorado River Basin Above Gunnison River,
W81-02676 7C

COMBINED SEWER OVERFLOWS
Urban Runoff Receiving Water Impacts: Program Overview and Research Needs,
W81-02748 5C

Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a Small Stream,
W81-02758 5C

Impacts of Intermittent Urban Discharges on Receiving Waters,
W81-02759 5C

The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

Potential of Urban Stormwater Impacts Based on Comparative Analysis of Wet and Dry Weather Pollutant Loads,
W81-02768 5C

Methodology for Evaluating the Impact and Abatement of Combined Sewer Overflows, A Case Study of Onondaga Lake, New York,
W81-02770 5C

Impact of a Combined Sewer Overflow on the Abundance, Distribution, and Community Structure of Subtidal Benthos,
W81-02820 5C

COMBINED SEWERS
The Distribution of Sediments and Particulate Contaminants from Combined Sewer and Storm Drain Overflows i Seattle's Nearshore Waters,
W81-02753 5B

Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

COMMERCIAL FISHING
Aquaculture: Opportunities for an Expanded Industry in Illinois,
W81-02797 8I

COMMUNITY DEVELOPMENT
Summary of Hydrologic Data for the East Everglades, Dade County, Florida,
W81-02697 7C

COMPUTER MODELS
Estimating Flood Damages in the State of Georgia,
W81-02720 6F

Development of a Streamflow Forecasting Procedure for Intermountain Basins,
W81-02726 6A

Affinity Tests for the Detection of Community Alteration in Plankton: Evaluation With a Distributional Computer Model,
W81-02860 5C

COMPUTER PROGRAMS
Computer Routines for Probability Distributions, Random Numbers, and Related Functions,
W81-02693 6A

COMPUTERS
Principle of Organization of an Automated Information System,
W81-02740 7C

Self-Organization of Three-Dimensional Models of Water Pollution,
W81-02745 5B

CONNECTICUT
Algal Response to Copper Under Riverine Conditions,
W81-02862 5C

CONTAMINATION
An Approach for Assessing the Water Quality Significance of Chemical Contaminants in Urban Lakes,
W81-02749 5C

COOPERATIVES
Directory of Assistance Centers of the National Water Data Exchange (NAWDEX),
W81-02681 10D

COPPER
Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

The Uptake of Lead and Copper by Submerged Aquatic Macrophytes in Two English Lakes,
W81-02827 5B

Algal Response to Copper Under Riverine Conditions,
W81-02862 5C

CORN
Use of Crop Canopy-Air Temperature Difference for Irrigation Scheduling,
W81-02724 3F

COST ANALYSIS
Optimal Sampling for Long Term Trends in Lake Huron,
W81-02733 7B

A Water Quality Planning Methodology for Urban Areas,
W81-02771 6B

COST-BENEFIT ANALYSIS
The Use of Receiving Water Quality Models in Urban Runoff Pollution Abatement: Application to Marginal Benefit - Marginal Cost Analysis,
W81-02769 5C

A Water Quality Planning Methodology for Urban Areas,
W81-02771 6B

COWEETA HYDROLOGIC LABORATORY
Coweeta Hydrologic Laboratory, 1934-2034: Past, Present and Future,
W81-02729 9C

CROP PRODUCTION
Use of Crop Canopy-Air Temperature Difference for Irrigation Scheduling,
W81-02724 3F

Irrigation of Crops in the Southeastern United States, Principles and Practice,
W81-02780 3F

CRUCES RIVER
Some Ecological Observations on Environmental Parameters, Planktonic Seasonal Succession and Biomass in Rio Cruces (Prov. Valdivia), South Chile,
W81-02876 5C

CULTIVATION
Conservation Tillage: Best Management Practice for Nonpoint Runoff,
W81-02818 4D

CYANOPHYTA
Interactions of Light and Nitrogen Source Among Planktonic Blue-Green Algae,
W81-02807 5C

CYCLES
Analyses of South African Rainfall,
W81-02873 2B

DADE COUNTY (FL)
Summary of Hydrologic Data for the East Everglades, Dade County, Florida,
W81-02697 7C

DAM STABILITY
Safety Evaluation of Existing Dams, A Manual for the Safety Evaluation of Embankment and Concrete Dams.
W81-02774 8A

DAMS
Safety Evaluation of Existing Dams, A Manual for the Safety Evaluation of Embankment and Concrete Dams.
W81-02774 8A

Long-Term Consequences of Upstream Impoundment,
W81-02835 6G

DAPHNIA
The Chronic Toxicity to Daphnia Magna of Acridine, a Representative Azaarene Present in Synthetic Fossil Fuel Products and Waste Waters,
W81-02864 5C

DATA ACQUISITION
Basic Trends in the Study of Hydrochemical Fields and the Structure of Their Space-Time Heterogeneities,
W81-02730 7A

DATA COLLECTIONS
Hydrologic Maps and Data for Santa Fe County, New Mexico,
W81-02703 7C

Principle of Organization of an Automated Information System,
W81-02740 7C

DATA STORAGE AND RETRIEVAL
Directory of Assistance Centers of the National Water Data Exchange (NAWDEX),
W81-02681 10D

Data Management Requirements for Great Lakes Water Quality Modeling,
W81-02732 7C

DEGRADATION
Modeling Sewage Sludge Decomposition in Soil: 1. Organic Carbon Transformation,
W81-02837 5D

DELAWARE RIVER
The Nitrogen Cycle in the Delaware River,
W81-02727 5C

DELTA-CLEARWATER AREA
Geohydrology of the Delta-Clearwater Area, Alaska,
W81-02688 2F

DENITRIFICATION
Modeling Sewage Sludge Decomposition in Soil: II. Nitrogen Transformations,
W81-02838 5E

DENMARK
The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a Small Stream,
W81-02758 5C

DESALINATION
High Recovery Seed Slurry Reverse Osmosis Demonstration for Desalting Waters Saturated in Calcium Sulfate.
W81-02659 3A

DESIGN CRITERIA
Industrial Wastewater Vs. the POTW,
W81-02884 5D

DETECTION LIMITS
Development of Methods for the Detection of Trace Amounts of Selected Carcinogenic and Mutagenic Amines in Water,
W81-02721 5A

DETERGENTS
Use of Synthetic Detergents in Malaysia,
W81-02896 5C

DETRITUS
Dynamics of Sediment and Organic Detritus in a Small Chalk Stream,
W81-02879 2J

DISCHARGE MEASUREMENT
Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

DISSOLVED OXYGEN
Effects of the Rate of Releases From Sam Rayburn Reservoir on the Aeration Capacity of the Angelina River, Eastern Texas,
W81-02686 4A

Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

Dissolved Oxygen Impact from Urban Storm Runoff,
W81-02757 5C

The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a Small Stream,
W81-02758 5C

DISSOLVED SOLIDS
The Distribution, Transport and Cycling of Dissolved and Particulate Organic Carbon in the Potomac and Anacostia Rivers in the Greater Washington Area,
W81-02656 5B

Results of a Joint USA/USSR Hydrodynamic Modeling Project for Lake Baikal,
W81-02737 2H

DISTRIBUTION PATTERNS
Primary Production of Phytoplankton and Environmental Characteristics of a Shallow Quaternary Lake at Eastern Brazil,
W81-02878 5C

DISTRIBUTION SYSTEMS
Scanning Electron Microscope Evidence for Bacterial Colonization of a Drinking-Water Distribution System,
W81-02812 5A

DISTRICT OF COLUMBIA
The Distribution, Transport and Cycling of Dissolved and Particulate Organic Carbon in the Potomac and Anacostia Rivers in the Greater Washington Area,
W81-02656 5B

DOMESTIC WASTES
Health Hazards and Pollution From Open Drains in a Nigerian City,
W81-02900 5B

DRINKING WATER
Determination of Lead in Drinking Water by Atomic Absorption Spectrophotometry with Electrothermal Atomisation,
W81-02811 5A

Enumeration and Characterization of Standard Plate Count Bacteria in Chlorinated and Raw Water Supplies,
W81-02848 5A

Simple Method for Concentration of Bacteria From Large Volumes of Tap Water,
W81-02853 5A

DROUGHTS
Preliminary Analysis of Regional-Precipitation Periodicity,
W81-02687 2B

DYNAMIC PROGRAMMING
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

EAST FORK RIVER (WY)
Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part I. River Hydraulics and Sediment Transport, 1979,
W81-02704 2J

Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part II. Bed Elevations, 1979,
W81-02705 2J

ECOLOGICAL EFFECTS
Principle of Organization of an Automated Information System,
W81-02740 7C

The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

ECOLOGY
Evidence for the Increased Eutrophication of Lake Nainital as a Result of Human Interference,
W81-02890 5C

ECONOMIC ASPECTS
Phase II Report - Preliminary Investigation of Small-Scale Hydropower Potential at Five Sites in Illinois,
W81-02790 6B

Adequacy and Economics of Water Supply in Northeastern Illinois: Proposed Groundwater and Regional Surface Water Systems, 1985-2010,
W81-02795 4B

ECONOMIC EVALUATION
The Long Run Profitability of Western Irrigated Agriculture: An In-Depth Analysis,
W81-02655 6C

ECONOMIC IMPACT
Estimating Flood Damages in the State of Georgia,
W81-02720 6F

ECONOMICS
Adequacy and Economics of Water Supply in Northeastern Illinois, 1985-2010,
W81-02796 6A

ECOSYSTEMS
A Model Approach to Estimating the Effects of Anthropogenic Influences on the Ecosystem of Lake Baikal,
W81-02734 5C

A Segmented Model of the Dynamics of the Ecosystem of Lake Baikal Considering Three-Dimensional Circulation of the Water,
W81-02747 2H

The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

The Effect of Glucose on the Productivity of Seawater: An Experimental Approach Using Controlled Aquatic Ecosystems,
W81-02825 5C

EDDY DIFFUSION
Simulation of the Distribution of Polluted Water in Reservoirs From Concentrated Emissions,
W81-02736 5B

EFFLUENTS
Isolation and Identification of an Ames-Mutagenic Compound Present in Kraft Chlorination Effluents,
W81-02875 5A

ELECTRIC POWER PRODUCTION
Phase I Report - Inventory of Potential Small-Scale Hydropower Sites in Illinois and Selection of Projects Exhibiting Potential for Development,
W81-02789 6B

ENERGY SOURCES
Small Scale Hydropower Development in Illinois: An Implementation Manual,
W81-02788 6B

ENEWETAK ATOLL
Global Transport of Organic Pollutants: Ambient Concentrations in the Remote Marine Atmosphere,
W81-02872 5B

ENTRAINMENT
A Review of Some Methods and Parameters Used in Assessing Effects of Water Intakes on Fish Populations,
W81-02742 5C

ENVIRONMENTAL EFFECTS
Environmental Effects of Western Coal Surface Mining, Part VI - Smallmouth Bass and Largemouth Bass in the Tongue River Reservoir, Montana, 1975-76,
W81-02775 5C

Proceedings of the Workshop on Aquatic Weeds: Control and its Environmental Consequences, Environmental Protection Agency, Environmental Research Laboratory, Gulf Breeze, Florida, February 25-26, 1980.
W81-02787 4A

Long-Term Consequences of Upstream Impoundment,
W81-02835 6G

Environmental Impact of Kraft Plant Effluents on Salmo Salar Ouananiche Analyzed by a New Method, the Coherence Graph. (Evaluation des Impacts Environnementaux Dus Au Rejets D'Une Usine de Pate Kraft Sur Le Salmo Salar Ouananiche A L'Aide D'Une Nouvelle Methode: Le Graphe de Coherence),
W81-02867 5C

ENVIRONMENTAL SURVEYS
Small Scale Hydropower Development in Illinois: An Implementation Manual,
W81-02788 6B

EQUATIONS
Relationships Between Basic Soils-Engineering Equations and Basic Ground-Water Flow Equations,
W81-02708 2F

EROSION
Dynamics of Sediment and Organic Detritus in a Small Chalk Stream,
W81-02879 2J

EROSION CONTROL
Conservation Tillage: Best Management Practice for Nonpoint Runoff,
W81-02818 4D

ESTIMATING EQUATIONS
Using Channel Geometry to Estimate Flood Flows at Ungaged Sites in Idaho,
W81-02679 6A

ESTUARIES
Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1974-September 1975,
W81-02684 2L

Vegetative Propagation of Some Saprolegniaceae Under Simulated-Estuarine-Culture Conditions,
W81-02814 2L

Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

Estuarine Fish Communities of the Eastern James-Hudson Bay Coast,
W81-02834 2L

Nitrogen and Phosphorus Distribution and Utilization by Spartina Alterniflora in a Louisiana Gulf Coast Marsh,
W81-02840 2L

Incidence of Marine Bdellovibrios Lytic Against Vibrio Parahaemolyticus in Chesapeake Bay,
W81-02845 5A

Rate of Occurrence of False-Positive Results From Total Coliform Most-Probable-Number Analysis of Shellfish and Estuaries,
W81-02847 2L

Yeasts From Marine and Estuarine Waters with Different Levels of Pollution in the State of Rio De Janeiro, Brazil,
W81-02885 5A

Comparison of the Different Methods for the Recovery of Suspended Matter From Estuarine Waters: Deposition, Filtration and Centrifugation: Consequences for the Determination of Some Heavy Metals,
W81-02888 5A

Reconstruction of Maldon STW,
W81-02899 5D

ESTUARINE ENVIRONMENT
The Nitrogen Cycle in the Delaware River,
W81-02727 5C

EUTROPHIC LAKES
An Approach for Assessing the Water Quality Significance of Chemical Contaminants in Urban Lakes,
W81-02749 5C

Phosphorus, Chlorophyll, and Eutrophic Lakes,
W81-02886 5C

EUTROPHICATION
A Spatially-Segmented Multi-Class Phytoplankton Model for Saginaw Bay, Lake Huron,
W81-02746 5C

Productivity Responses of Lake Eola to Urban Runoff,
W81-02763 5C

Fungal Pathogen of Cladophora Glomerata (Chlorophyta),
W81-02846 5G

The Inadequacy of Existing Chlorophyll-a/Phosphorus Concentration Correlations for Assessing Remedial Measures for Hypertrophic Lakes,
W81-02856 5C

Phosphorus, Chlorophyll, and Eutrophic Lakes,
W81-02886 5C

Evidence for the Increased Eutrophication of Lake Nainital as a Result of Human Interference,
W81-02890 5C

Use of Synthetic Detergents in Malaysia,
W81-02896 5C

FAUNA
The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

FEASIBILITY STUDIES
The Feasibility of a Regional Industrial Waste Water Treatment Facility,
W81-02786 5D

Phase I Report - Inventory of Potential Small-Scale Hydropower Sites in Illinois and Selection of Projects Exhibiting Potential for Development,
W81-02789 6B

Phase II Report - Preliminary Investigation of Small-Scale Hydropower Potential at Five Sites in Illinois,
W81-02790 6B

FEEDLOT RUNOFF
The Effect of Beef Feedlot Runoff on the Nitrate-Nitrogen Content of a Shallow Aquifer,
W81-02828 5B

FERRIC CHLORIDE
The Effect of pH on the Coagulation and Purification of Wastewater,
W81-02832 5D

FERTILIZERS
Elemental Content of Vegetables and Apple Trees Grown on Syracuse Sludge-Amended Soils,
W81-02830 5E

FILTERS
Simple Method for Concentration of Bacteria From Large Volumes of Tap Water,
W81-02853 5A

FISH FARMING
Aquaculture: Catfish and Trout, Inventory and Sales, 1980.
W81-02776 8I

Aquaculture: Opportunities for an Expanded Industry in Illinois,
W81-02797 8I

FISH HATCHERIES
A Solar Heated Fish Hatchery Water Recycling System,
W81-02709 8I

Temperature-Controlled Recirculating System for Hatching Catostomid Larvae,
W81-02728 8I

FISH HATCHING SYSTEM
Temperature-Controlled Recirculating System for Hatching Catostomid Larvae,
W81-02728 8I

FISH POPULATIONS
A Review of Some Methods and Parameters Used in Assessing Effects of Water Intakes on Fish Populations,
W81-02742 5C

Environmental Effects of Western Coal Surface Mining, Part VI - Smallmouth Bass and Largemouth Bass in the Tongue River Reservoir, Montana, 1975-76,
W81-02775 5C

Estuarine Fish Communities of the Eastern James-Hudson Bay Coast,
W81-02834 2L

FLOCCULATION
Multi Stage Flocculation Treatment System,
W81-02805 5D

Recovery of Coliphages From Waste Water Effluents and Polluted Lake Water by the Magnetite-Organic Flocculation Method,
W81-02852 5A

FLOOD DAMAGE
Estimating Flood Damages in the State of Georgia,
W81-02720 6F

FLOOD DATE
Estimating Flood Damages in the State of Georgia,
W81-02720 6F

FLOOD FLOW
Using Channel Geometry to Estimate Flood Flows at Ungaged Sites in Idaho,
W81-02679 6A

FLOOD FREQUENCY
Using Channel Geometry to Estimate Flood Flows at Ungaged Sites in Idaho,
W81-02679 6A

Evaluation of Peak-Flow Data Network of Small Streams in Missouri,
W81-02689 2E

Flood Frequency Modeling and Outliers,
W81-02803 2E

FLORIDA
Summary of Hydrologic Data for the East Everglades, Dade County, Florida,
W81-02697 7C

Water-Resources Investigations, Collier County, Florida,
W81-02699 5G

Impacts of Stormwater Runoff on a Florida Lake Ecosystem: Effects on Water Quality and Biota,
W81-02752 5C

FLUORIDES
Geochemistry of Fluoride in the Black Creek Aquifer System of Horry and Georgetown Counties, South Carolina--and its Physiological Implications,
W81-02677 5G

FLUROIDES
The Effect of a Fluoride Effluent on Marine Organisms,
W81-02863 5C

FLUVIAL SEDIMENTS
Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part I. River Hydraulics and Sediment Transport, 1979,
W81-02704 2J

FLY ASH
Hydrochemical and Geophysical Investigation of the Effects of Fly-Ash Disposal on Groundwater,
W81-02651 5C

Effects of Fly Ash Heavy Metals on Daphnia Magna,
W81-02715 5B

FOREST WATERSHEDS
Changes in Nitrogen Cycling at an Old-Growth Douglas-Fir Site After Disturbance,
W81-02844 5C

FORESTRY
Coweeta Hydrologic Laboratory, 1934-2034: Past, Present and Future,
W81-02729 9C

FRANCE
Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

Comparison of the Different Methods for the Recovery of Suspended Matter From Estuarine Waters: Deposition, Filtration and Centrifugation: Consequences for the Determination of Some Heavy Metals,
W81-02888 5A

FRESNO
Brine Pollution at Fresno - Twenty-Six Years Later,
W81-02843 5B

FUEL
The Chronic Toxicity to Daphnia Magna of Acridine, a Representative Azaarene Present in Synthetic Fossil Fuel Products and Waste Waters,
W81-02864 5C

FUNGI
Vegetative Propagation of Some Saprolegniaceae Under Simulated-Estuarine-Culture Conditions,
W81-02814 2L

GAGING STATIONS
Streamflow Statistical Summaries for Colorado Streams Through September 30, 1975, Volume 2: Colorado River Basin Above Gunnison River,
W81-02676 7C

GAS CHROMATOGRAPHY
GC/MS Methodology for Measuring Priority Organics in Municipal Waste Water Treatment,
W81-02784 5A

GEOCHEMISTRY
Geochemistry of Fluoride in the Black Creek Aquifer System of Horry and Georgetown Counties, South Carolina--and its Physiological Implications,
W81-02677 5G

Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

METABOLISM
Evidence for Cometabolism in Sewage,
W81-02849 5B

METAL-FINISHING WASTES
Laboratory and Field Evaluation of NS-100 Reverse Osmosis Membrane,
W81-02777 5D

METALS
The Uptake of Lead and Copper by Submerged Aquatic Macrophytes in Two English Lakes,
W81-02827 5B

METEOROLOGY
Preliminary Analysis of Regional-Precipitation Periodicity,
W81-02687 2B

METHYLMERCURY
Studies on the Photochemical Decomposition of Organomercurials--Methylmercury(II) Chloride,
W81-02816 5B

MEXICO QUADRANGLE (NY)
Surficial Geology of Mexico Quadrangle, Oswego County, New York,
W81-02671 7C

MICROORGANISMS
Biodegradation of Chemicals of Environmental Concern,
W81-02871 5B

Hydrocarbon-Utilising Micro-Organisms From Dona Paula Bay, Goa,
W81-02893 5B

MILWAUKEE RIVER
Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

MINE WASTES
Transport of Mining Waste in Lake Superior,
W81-02739 5B

Environmental Effects of Western Coal Surface Mining, Part VI - Smallmouth Bass and Largemouth Bass in the Tongue River Reservoir, Montana, 1975-76,
W81-02775 5C

MINERALOGY
Chemical and Mineralogical Composition and Behavior of the Mancos Shale as a Diffuse Source of Salts in the Upper Colorado River Basin,
W81-02711 5B

MISSOURI
Effects of the Proposed Prosperity Reservoir on Ground Water and Water Quality in Lower Center Creek Basin, Missouri,
W81-02678 5B

Evaluation of Peak-Flow Data Network of Small Streams in Missouri,
W81-02689 2E

Industrial Wastewater Vs. the POTW,
W81-02884 5D

MODEL STUDIES
Evaluation of the Impact Imposed upon Surface Water Sources by Implementation of the Federal Water Conservation and Reuse Policy in a River Basin with a Water Surplus,
W81-02654 3C

Effects of Artificial-Recharge Experiments at Ship Creek Alluvial Fan on Water Levels at Spring Acres Subdivision, Anchorage, Alaska,
W81-02696 4B

Modeling the Great Lakes - A History of Achievement,
W81-02731 7A

Data Management Requirements for Great Lakes Water Quality Modeling,
W81-02732 7C

Optimal Sampling for Long Term Trends in Lake Huron,
W81-02733 7B

A Model Approach to Estimating the Effects of Anthropogenic Influences on the Ecosystem of Lake Baikal,
W81-02734 5C

Self-Organization of Three-Dimensional Models of Water Pollution,
W81-02745 5B

A Spatially-Segmented Multi-Class Phytoplankton Model for Saginaw Bay, Lake Huron,
W81-02746 5C

A Segmented Model of the Dynamics of the Ecosystem of Lake Baikal Considering Three-Dimensional Circulation of the Water,
W81-02747 2H

Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

The Use of Receiving Water Quality Models in Urban Runoff Pollution Abatement: Application to Marginal Benefit - Marginal Cost Analysis,
W81-02769 5C

A Two-Mode Free-Surface Numerical Model for the Three-Dimensional Time-Dependent Currents in Large Lakes,
W81-02778 2H

Adequacy and Economics of Water Supply in Northeastern Illinois, 1985-2010,
W81-02796 6A

Modeling Sewage Sludge Decomposition in Soil: 1. Organic Carbon Transformation,
W81-02837 5D

Modeling Sewage Sludge Decomposition in Soil: II. Nitrogen Transformations,
W81-02838 5E

MOLLUSKS
Determination of Maganese in Naiad Mollusc Shells by Neutron Activation Analysis,
W81-02859 5A

Heavy Metals in Donax Trunculus L. (Bivalvia) in Haifa Bay, Mediterranean (Israel),
W81-02894 5A

MONITORING
A Water-Quality Monitoring Network for Vallecitos Valley, Alameda County, California,
W81-02685 5B

MONONGAHELA RIVER
The Feasibility of a Regional Industrial Waste Water Treatment Facility,
W81-02786 5D

MONTANA
Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

MORTALITY
A Review of Some Methods and Parameters Used in Assessing Effects of Water Intakes on Fish Populations,
W81-02742 5C

MOST PROBABLE NUMBER TEST
Rate of Occurrence of False-Positive Results From Total Coliform Most-Probable-Number Analysis of Shellfish and Estuaries,
W81-02847 2L

MULTIVARIATE ANALYSIS
Use of Crop Canopy-Air Temperature Difference for Irrigation Scheduling,
W81-02724 3F

MUNICIPAL WASTE WATER
GC/MS Methodology for Measuring Priority Organics in Municipal Waste Water Treatment,
W81-02784 5A

MUNICIPAL WATER
The Search for Equity and Efficiency in the Pricing of a Public Service: Urban Water,
W81-02831 6C

MUSSELS
Measurement of Physiological Condition of Mussels Transplanted Along a Pollution Gradient in Narragansett Bay,
W81-02819 5C

Organochlorine Compounds in Mussels From Scottish Coastal Waters,
W81-02858 5A

NAIADS
Determination of Maganese in Naiad Mollusc Shells by Neutron Activation Analysis,
W81-02859 5A

NARRAGANSETT BAY
Measurement of Physiological Condition of Mussels Transplanted Along a Pollution Gradient in Narragansett Bay,
W81-02819 5C

Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

NATIONAL WATER DATA EXCHANGE (NAWDEX)
Directory of Assistance Centers of the National Water Data Exchange (NAWDEX),
W81-02681 10D

NEBRASKA
Public Attitudes of Nebraskans Toward Water Policy,
W81-02725 6E

NEVADA
Water Resources Data for Nevada, Water Year 1979.
W81-02698 7C

NEW HAVEN QUADRANGLE (NY)
Surficial Geology of New Haven Quadrangle, Oswego County, New York,
W81-02661 7C

NEW MEXICO
Hydrologic Maps and Data for Santa Fe County, New Mexico,
W81-02703 7C

NEW YORK
Surficial Geology of New Haven Quadrangle, Oswego County, New York,
W81-02661 7C

Surficial Geology of Orwell Quadrangle, Oswego County, New York,
W81-02662 7C

Surficial Geology of Part of Lysander Quadrangle, Oswego County, New York,
W81-02663 7C

Surficial Geology of Redfield Quadrangle, Oswego County, New York,
W81-02664 7C

Surficial Geology of Part of Boylston Center Quadrangle, Oswego County, New York,
W81-02665 7C

Surficial Geology of Part of Sandy Creek Quadrangle, Oswego County, New York,
W81-02666 7C

Surficial Geology of Part of Worth Center Quadrangle, Oswego County, New York,
W81-02667 7C

Surficial Geology of Oswego West Quadrangle, Oswego County, New York,
W81-02668 7C

Surficial Geology of Oswego East Quadrangle, Oswego County, New York,
W81-02669 7C

Surficial Geology of Central Square Quadrangle, Oswego County, New York,
W81-02670 7C

Surficial Geology of Mexico Quadrangle, Oswego County, New York,
W81-02671 7C

Permeability of Covers Over Low-Level Radioactive-Waste Burial Trenches, West Valley, Cattaraugus County, New York,
W81-02692 5E

NEW ZEALAND
The Effect of a Fluoride Effluent on Marine Organisms,
W81-02863 5C

The Macrobenthos of Lakes Rotoroa and Rotoiti, South Island, New Zeland, With Special Reference to the Influence of Allochthonous Organic Detritus,
W81-02880 2H

NIGERIA
Health Hazards and Pollution From Open Drains in a Nigerian City,
W81-02900 5B

NITRATE
Changes in Nitrogen Cycling at an Old-Growth Douglas-Fir Site After Disturbance,
W81-02844 5C

NITRATES
The Effect of Beef Feedlot Runoff on the Nitrate-Nitrogen Content of a Shallow Aquifer,
W81-02828 5B

NITRIFICATION
The Nitrogen Cycle in the Delaware River,
W81-02727 5C

NITRILOTRIACETIC ACID
Relative Degradation Rates of NTA, EDTA and DTPA and Environmental Implications,
W81-02868 5B

NITROGEN
Phosphorus and Nitrogen in the Mediterranean Sea: Budgets and Potential Fertility. (Le Phosphore et L'Azote En Mer Mediterranee, Bilans et Fertilite Potentielle),
W81-02891 5B

NITROGEN COMPOUNDS
Development of Methods for the Detection of Trace Amounts of Selected Carcinogenic and Mutagenic Amines in Water,
W81-02721 5A

Detection of Dimethylnitrosamine and Diethylnitrosamine in Municipal Sewage Sludge Applied to Agricultural Soils,
W81-02866 5A

NITROGEN CYCLE
The Nitrogen Cycle in the Delaware River,
W81-02727 5C

Nitrogen and Phosphorus Distribution and Utilization by Spartina Alterniflora in a Louisiana Gulf Coast Marsh,
W81-02840 2L

NITROGEN FIXATION
Interactions of Light and Nitrogen Source Among Planktonic Blue-Green Algae,
W81-02807 5C

NORTH CAROLINA
Urban Stormwater Impacts on Receiving Streams in North Carolina,
W81-02756 5C

NUCLEAR POWERPLANTS
Distribution of Activation Products from Barseback Nuclear Power Plant (Sweden) in the Marine Environment. Temporal and Spatial Variations as Established by Seaweed,
W81-02815 5B

Non-Radiological Environmental Implications of Nuclear Energy,
W81-02895 5C

NUCLEAR WASTES
Chemical Treatments of Soil to Decrease Radiostrontium Leachability,
W81-02826 5G

NUTRIENT REMOVAL
The Politics of Water Pollution Control: A Case Study of the Formation of the Canada Water Act, Part I: Comprehensive Water Resource Management: Part II: Nutrient Control,
W81-02836 6E

NUTRIENTS
An Approach for Assessing the Water Quality Significance of Chemical Contaminants in Urban Lakes,
W81-02749 5C

A Comparison of Rain-Related Phosphorus and Nitrogen Loading from Urban, Wetland, and Agricultural Sources,
W81-02751 5C

Impacts of Stormwater Runoff on a Florida Lake Ecosystem: Effects on Water Quality and Biota,
W81-02752 5C

ODOR
Detection of Lipid Degradation Products in the Water of a Reservoir During a Bloom of Synura Uvella,
W81-02850 5A

OHIO
Groundwater Contamination Potential at 21 Industrial Waste-Water Impoundments in Ohio,
W81-02841 5B

Determination of Maganese in Naiad Mollusc Shells by Neutron Activation Analysis,
W81-02859 5A

OHIO RIVER BASIN (PA)
Ground-Water Quality and Data on Wells and Springs in Pennsylvania, Volume I--Ohio and St. Lawrence River Basins,
W81-02675 7C

OIL POLLUTION
Incidence of Plasmids in Marine Vibrio SPP. Isolated From an Oil Field in the Northwestern Gulf of Mexico,
W81-02813 5A

Coal-Liquefaction Products, Shale Oil, and Petroleum. Acute Toxicity to Freshwater Algae,
W81-02854 5C

OIL SPILLS
Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

Persistence of Spilled Oil in a Texas Salt Marsh,
W81-02857 5B

OKLAHOMA
Selected Water-Level Records for Oklahoma, 1979-80,
W81-02683 2F

OLIGOTROPHY
Turnover Rate of Dissolved Organic Materials in Glacially-Oligotrophic and Dystrophic Lakes in British Columbia, Canada,
W81-02806 2H

ONTARIO
Growth Responses of Yellow Perch, Perca Flavescens (Mitchill), to Lake Acidification in the La Cloche Mountain Lakes of Ontario,
W81-02833 5C

OPTICAL PROPERTIES
Simultaneous Measurements of Transparency and Irradiance in the Coastal Waters of North Wales,
W81-02892 5A

OREGON
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

ORGANIC CARBON
The Distribution, Transport and Cycling of Dissolved and Particulate Organic Carbon in the Potomac and Anacostia Rivers in the Greater Washington Area,
W81-02656 5B

ORGANIC COMPOUNDS
GC/MS Methodology for Measuring Priority Organics in Municipal Waste Water Treatment,
W81-02784 5A

Detection of Lipid Degradation Products in the Water of a Reservoir During a Bloom of Synura Uvella,
W81-02850 5A

Utilization of Low Concentrations of Starch by a Flavobacterium Species Isolated From Tap Water,
W81-02851 5A

The Chronic Toxicity to Daphnia Magna of Acridine, a Representative Azaarene Present in Synthetic Fossil Fuel Products and Waste Waters,
W81-02864 5C

Detection of Dimethylnitrosamine and Diethylnitrosamine in Municipal Sewage Sludge Applied to Agricultural Soils,
W81-02866 5A

Biodegradation of Chemicals of Environmental Concern,
W81-02871 5B

Global Transport of Organic Pollutants: Ambient Concentrations in the Remote Marine Atmosphere,
W81-02872 5B

Hydrocarbon-Utilising Micro-Organisms From Dona Paula Bay, Goa,
W81-02893 5B

ORGANIC MATTER
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

Turnover Rate of Dissolved Organic Materials in Glacially-Oligotrophic and Dystrophic Lakes in British Columbia, Canada,
W81-02806 2H

Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

Molecular Weight Distribution and Characterization of Dissolved Organic Matter From Lake Waters,
W81-02877 2H

ORWELL QUADRANGLE (NY)
Surficial Geology of Orwell Quadrangle, Oswego County, New York,
W81-02662 7C

OSWEGO COUNTY (NY)
Surficial Geology of New Haven Quadrangle, Oswego County, New York,
W81-02661 7C

Surficial Geology of Orwell Quadrangle, Oswego County, New York,
W81-02662 7C

Surficial Geology of Part of Lysander Quadrangle, Oswego County, New York,
W81-02663 7C

Surficial Geology of Redfield Quadrangle, Oswego County, New York,
W81-02664 7C

Surficial Geology of Part of Boylston Center Quadrangle, Oswego County, New York,
W81-02665 7C

Surficial Geology of Part of Sandy Creek Quadrangle, Oswego County, New York,
W81-02666 7C

Surficial Geology of Part of Worth Center Quadrangle, Oswego County, New York,
W81-02667 7C

Surficial Geology of Oswego West Quadrangle, Oswego County, New York,
W81-02668 7C

Surficial Geology of Oswego East Quadrangle, Oswego County, New York,
W81-02669 7C

Surficial Geology of Central Square Quadrangle, Oswego County, New York,
W81-02670 7C

Surficial Geology of Mexico Quadrangle, Oswego County, New York,
W81-02671 7C

OSWEGO EAST QUADRANGLE (NY)
Surficial Geology of Oswego East Quadrangle, Oswego County, New York,
W81-02669 7C

OSWEGO WEST QUADRANGLE (NY)
Surficial Geology of Oswego West Quadrangle, Oswego County, New York,
W81-02668 7C

OVERLAND FLOW
Overland Flow: Removal of Toxic Volatile Organics,
W81-02779 5D

PACIFIC SLOPE BASINS
Water Resources Data for California, Water Year 1979--Volume 2. Pacific Slope Basins from Arroyo Grande to Oregon State Line Except Central Valley.
W81-02672 7C

PAKISTAN
Wastewater Effluents From a Tannery: Their Effects on Soil and Vegetation in Pakistan,
W81-02897 3C

PAPER PULP WASTES
Environmental Impact of Kraft Plant Effluents on Salmo Salar Ouananiche Analyzed by a New Method, the Coherence Graph. (Evaluation des Impacts Environnementaux Dus Au Rejets D'Une Usine de Pate Kraft Sur Le Salmo Salar Ouananiche A L'Aide D'Une Nouvelle Methode: Le Graphe de Coherence),
W81-02867 5C

PARTICULATE MATTER
The Distribution, Transport and Cycling of Dissolved and Particulate Organic Carbon in the Potomac and Anacostia Rivers in the Greater Washington Area,
W81-02656 5B

Transport of Mining Waste in Lake Superior,
W81-02739 5B

PATENTS
Process for Removal of Discrete Particulates and Solutes from Liquids by Foam Flotation,
W81-02660 5D

Multi Stage Flocculation Treatment System,
W81-02805 5D

PATH OF POLLUTANTS
Mechanisms of Transport of Copper, Cadmium and Chromium in Soils,
W81-02653 5B

Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

Persistence of Spilled Oil in a Texas Salt Marsh,
W81-02857 5B

Fate of Chromium in a Tributary of the Iraja River, Rio De Janeiro,
W81-02865 5B

Relative Degradation Rates of NTA, EDTA and DTPA and Environmental Implications,
W81-02868 5B

Biodegradation of Chemicals of Environmental Concern,
W81-02871 5B

Global Transport of Organic Pollutants: Ambient Concentrations in the Remote Marine Atmosphere,
W81-02872 5B

PATHOGENIC BACTERIA
Waste Water Spray Transport in Land Application,
W81-02722 3F

PEAK DISCHARGE
Evaluation of Peak-Flow Data Network of Small Streams in Missouri,
W81-02689 2E

PENNSYLVANIA
Ground-Water Quality and Data on Wells and Springs in Pennsylvania, Volume I--Ohio and St. Lawrence River Basins,
W81-02675 7C

Sediment Characteristics of Eleocharis Acicularis (L.) R. S. Sites in Streams and Lakes of Central Pennsylvania,
W81-02821 5C

PERCH
Growth Responses of Yellow Perch, Perca Flavescens (Mitchill), to Lake Acidification in the La Cloche Mountain Lakes of Ontario,
W81-02833 5C

PERIPHERAL CANAL
California's Water Conflict: North vs South,
W81-02809 6E

PERMEABILITY
Permeability of Covers Over Low-Level Radioactive-Waste Burial Trenches, West Valley, Cattaraugus County, New York,
W81-02692 5E

PESTICIDE RESIDUES
Organochlorine Compounds in Mussels From Scottish Coastal Waters,
W81-02858 5A

PHENOLS
Chromatographic Enrichment of Acidic Compounds From Organic Solvents Using Alkali Metal Silicates,
W81-02829 5A

PHOSPHATES
The Politics of Water Pollution Control: A Case Study of the Formation of the Canada Water Act, Part I: Comprehensive Water Resource Management: Part II: Nutrient Control,
W81-02836 6E

PHOSPHORUS
Phosphate Removal with Calcium Carbonate Precipitation in the Lake of Constance (Obersee). (Phosphatelimination Durch Autochthone Calcitfallung Im Bodensee-Obersee),
W81-02882 5D

Phosphorus and Nitrogen in the Mediterranean Sea: Budgets and Potential Fertility. (Le Phosphore et L'Azote En Mer Mediterranee, Bilans et Fertilite Potentielle),
W81-02891 5B

PHOSPHORUS COMPOUNDS
Nitrogen and Phosphorus Distribution and Utilization by Spartina Alterniflora in a Louisiana Gulf Coast Marsh,
W81-02840 2L

Phosphorus, Chlorophyll, and Eutrophic Lakes,
W81-02886 5C

PHOSPHORUS REMOVAL
Use of Calcium Stripping Column to Achieve Energy Conservation and Residue Reuse in Phosphate Precipitation by Lime,
W81-02713 5D

PHYSICAL PROPERTIES
Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1974-September 1975,
W81-02684 2L

PHYTOPLANKTON
A Spatially-Segmented Multi-Class Phytoplankton Model for Saginaw Bay, Lake Huron,
W81-02746 5C

Affinity Tests for the Detection of Community Alteration in Plankton: Evaluation With a Distributional Computer Model,
W81-02860 5C

Some Ecological Observations on Environmental Parameters, Planktonic Seasonal Succession and Biomass in Rio Cruces (Prov. Valdivia), South Chile,
W81-02876 5C

Primary Production of Phytoplankton and Environmental Characteristics of a Shallow Quaternary Lake at Eastern Brazil,
W81-02878 5C

PILOT PLANTS
Caprolactam Recovery from Aqueous Manufacturing Streams,
W81-02783 5D

PIPE FLOW
Algorithms for Pipe Network Analysis and Their Reliability,
W81-02658 8C

PLANKTON
Interactions of Light and Nitrogen Source Among Planktonic Blue-Green Algae,
W81-02807 5C

PLASMIDS
Incidence of Plasmids in Marine Vibrio SPP. Isolated From an Oil Field in the Northwestern Gulf of Mexico,
W81-02813 5A

PLATING INDUSTRY
Fate of Chromium in a Tributary of the Iraja River, Rio De Janeiro,
W81-02865 5B

POLAND
Poland Launches Major Program to Restore and Regulate Country's Largest River System,
W81-02889 5D

POLICY MAKING
Public Attitudes of Nebraskans Toward Water Policy,
W81-02725 6E

POLLUTANT IDENTIFICATION
Determination of Lead in Drinking Water by Atomic Absorption Spectrophotometry with Electrothermal Atomisation,
W81-02811 5A

Scanning Electron Microscope Evidence for Bacterial Colonization of a Drinking-Water Distribution System,
W81-02812 5A

Detection of Dimethylnitrosamine and Diethylnitrosamine in Municipal Sewage Sludge Applied to Agricultural Soils,
W81-02866 5A

Yeasts From Marine and Estuarine Waters with Different Levels of Pollution in the State of Rio De Janeiro, Brazil,
W81-02885 5A

Heavy Metals in Donax Trunculus L. (Bivalvia) in Haifa Bay, Mediterranean (Israel),
W81-02894 5A

POLLUTANTS
Simulation of the Distribution of Polluted Water in Reservoirs From Concentrated Emissions,
W81-02736 5B

Brine Pollution at Fresno - Twenty-Six Years Later,
W81-02843 5B

POLLUTION LOAD
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

Mechanisms of Transport of Copper, Cadmium and Chromium in Soils,
W81-02653 5B

POLYCHAETES
The Distribution of the Polychaete Capitella Capitata (Fabricius) in Dock Sediments,
W81-02887 5C

POPLAR RIVER (MT)
Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

POPULATION DYNAMICS
A Review of Some Methods and Parameters Used in Assessing Effects of Water Intakes on Fish Populations,
W81-02742 5C

POTABLE WATER
Utilization of Low Concentrations of Starch by a Flavobacterium Species Isolated From Tap Water,
W81-02851 5A

POWERPLANTS
Effects of Coal-Ash Leachate on Ground Water Quality,
W81-02785 5B

Non-Radiological Environmental Implications of Nuclear Energy,
W81-02895 5C

PRECIPITATION (ATMOSPHERIC)
Preliminary Analysis of Regional-Precipitation Periodicity,
W81-02687 2B

PREDICTION
The Structure of Hydrochemical Fields and Short-Term Prediction,
W81-02738 2A

PRICING
The Search for Equity and Efficiency in the Pricing of a Public Service: Urban Water,
W81-02831 6C

PROBABILITY DISTRIBUTION
Computer Routines for Probability Distributions, Random Numbers, and Related Functions,
W81-02693 6A

PROCESS WATER
Caprolactam Recovery from Aqueous Manufacturing Streams,
W81-02783 5D

PRODUCTIVITY
Productivity Responses of Lake Eola to Urban Runoff,
W81-02763 5C

The Effect of Glucose on the Productivity of Seawater: An Experimental Approach Using Controlled Aquatic Ecosystems,
W81-02825 5C

PROFIT
The Long Run Profitability of Western Irrigated Agriculture: An In-Depth Analysis,
W81-02655 6C

PROJECT PLANNING
Study Plan for the Regional Aquifer-System Analysis of Alluvial Basins in South-Central Arizona and Adjacent States,
W81-02701 6A

PROSPERITY RESERVOIR (MO)
Effects of the Proposed Prosperity Reservoir on Ground Water and Water Quality in Lower Center Creek Basin, Missouri,
W81-02678 5B

PUBLIC HEALTH
Health Hazards and Pollution From Open Drains in a Nigerian City,
W81-02900 5B

PUBLIC OPINION
Public Attitudes of Nebraskans Toward Water Policy,
W81-02725 6E

PUGET SOUND
Impact of a Combined Sewer Overflow on the Abundance, Distribution, and Community Structure of Subtidal Benthos,
W81-02820 5C

PULP WASTES
Clay is Mosinee's Choice for Reducing TSS Discharge from Clarifier,
W81-02874 5D

Isolation and Identification of an Ames-Mutagenic Compound Present in Kraft Chlorination Effluents,
W81-02875 5A

PUMPING
Application of Wind Energy to Great Plains Irrigation Pumping,
W81-02781 8C

RADIOACTIVE WASTE DISPOSAL
Permeability of Covers Over Low-Level Radioactive-Waste Burial Trenches, West Valley, Cattaraugus County, New York,
W81-02692 5E

RADIOACTIVE WASTES
A Water-Quality Monitoring Network for Vallecitos Valley, Alameda County, California,
W81-02685 5B

RADIOISOTOPES
A Water-Quality Monitoring Network for Vallecitos Valley, Alameda County, California,
W81-02685 5B

Distribution of Activation Products from Barseback Nuclear Power Plant (Sweden) in the Marine Environment. Temporal and Spatial Variations as Established by Seaweed,
W81-02815 5B

RAINFALL
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

Summary of Hydrologic Data for the East Everglades, Dade County, Florida,
W81-02697 7C

Water Quality and Urban Runoff in Selected Canal Communities Along the Texas Coast,
W81-02761 5C

Analyses of South African Rainfall,
W81-02873 2B

RAW WATER
Enumeration and Characterization of Standard Plate Count Bacteria in Chlorinated and Raw Water Supplies,
W81-02848 5A

RECLAIMED WATER
Water Quality of a Reservoir Used for Reclaimed Water Storage,
W81-02712 5G

RECREATION WASTES
Hoover Dam Advanced Waste Treatment System; Volume I, Pilot Studies Report.
W81-02772 5D

REDFIELD QUADRANGLE (NY)
Surficial Geology of Redfield Quadrangle, Oswego County, New York,
W81-02664 7C

REDWATER RIVER (MT)
Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and

Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

REEFS
Kelp Beds at Saunders Reef, Mendocino County.
W81-02799 5C

REGIONAL ANALYSIS
Study Plan for the Regional Aquifer-System Analysis of Alluvial Basins in South-Central Arizona and Adjacent States,
W81-02701 6A

REGIONAL DEVELOPMENT
Control of the Water Resources of the Azov Sea Using the 'Azov Problem' Family of Simulation Systems,
W81-02743 6A

REMOTE SENSING
Aircraft Remote Sensing of Soil Moisture and Hydrologic Parameters, Chickasha, Okla., and Riesel, Tex., 1978 Data Report,
W81-02782 2G

Snowpack Monitoring in North America and Eurasia Using Passive Microwave Satellite Data,
W81-02869 7B

RESEARCH
USGS: Its Water Resources Research Activity,
W81-02839 9C

RESEARCH FACILITIES
Coweeta Hydrologic Laboratory, 1934-2034: Past, Present and Future,
W81-02729 9C

USGS: Its Water Resources Research Activity,
W81-02839 9C

RESEARCH PRIORITIES
Basic Trends in the Study of Hydrochemical Fields and the Structure of Their Space-Time Heterogeneities,
W81-02730 7A

RESERVOIR RELEASES
Effects of the Rate of Releases From Sam Rayburn Reservoir on the Aeration Capacity of the Angelina River, Eastern Texas,
W81-02686 4A

RESERVOIR SITES
Effects of the Proposed Prosperity Reservoir on Ground Water and Water Quality in Lower Center Creek Basin, Missouri,
W81-02678 5B

RESERVOIRS
Water Quality of a Reservoir Used for Reclaimed Water Storage,
W81-02712 5G

Simulation of the Distribution of Polluted Water in Reservoirs From Concentrated Emissions,
W81-02736 5B

Detection of Lipid Degradation Products in the Water of a Reservoir During a Bloom of Synura Uvella,
W81-02850 5A

REVERSE OSMOSIS
High Recovery Seed Slurry Reverse Osmosis Demonstration for Desalting Waters Saturated in Calcium Sulfate.
W81-02659 3A

Advanced Pretreatment Process for Waste Water Reuse Using Reverse Osmosis,
W81-02710 5D

Hoover Dam Advanced Waste Treatment System; Volume I, Pilot Studies Report.
W81-02772 5D

Hoover Dam Advanced Waste Treatment System: Volume II, Pilot Studies Summary Data.
W81-02773 5D

Laboratory and Field Evaluation of NS-100 Reverse Osmosis Membrane,
W81-02777 5D

RIO DE JANEIRO
Yeasts From Marine and Estuarine Waters with Different Levels of Pollution in the State of Rio De Janeiro, Brazil,
W81-02885 5A

RIVER BASINS
Development of a Groundwater Model for the Henry's Fork and Rigby Fan Areas, Upper Snake River Basin, Idaho,
W81-02804 6A

RIVER FLOW
The Response of Great Lakes Estuaries to Stormwater Runoff,
W81-02760 5C

RIVERS
Bank Erosion of the Illinois River,
W81-02791 2J

Algal Response to Copper Under Riverine Conditions,
W81-02862 5C

Poland Launches Major Program to Restore and Regulate Country's Largest River System,
W81-02889 5D

ROOTED AQUATIC PLANTS
Sediment Characteristics of Eleocharis Acicularis (L.) R. S. Sites in Streams and Lakes of Central Pennsylvania,
W81-02821 5C

RUNOFF
Statistics of Receiving Water Response to Runoff,
W81-02766 5C

RUNOFF FORECASTING
Development of a Streamflow Forecasting Procedure for Intermountain Basins,
W81-02726 6A

RUSSIA
A Model Approach to Estimating the Effects of Anthropogenic Influences on the Ecosystem of Lake Baikal,
W81-02734 5C

Results of a Joint USA/USSR Hydrodynamic Modeling Project for Lake Baikal,
W81-02737 2H

Control of the Water Resources of the Azov Sea Using the 'Azov Problem' Family of Simulation Systems,
W81-02743 6A

A Segmented Model of the Dynamics of the Ecosystem of Lake Baikal Considering Three-Dimensional Circulation of the Water,
W81-02747 2H

SAFETY
Safety Evaluation of Existing Dams, A Manual for the Safety Evaluation of Embankment and Concrete Dams.
W81-02774 8A

SALINE WATER INTRUSION
Seawater Intrusion and Potential Yield of Aquifers in the Soquel-Aptos Area, Santa Cruz County, California,
W81-02690 5B

SALINITY
Chemical and Mineralogical Composition and Behavior of the Mancos Shale as a Diffuse Source of Salts in the Upper Colorado River Basin,
W81-02711 5B

SALT MARSHES
Nitrogen and Phosphorus Distribution and Utilization by Spartina Alterniflora in a Louisiana Gulf Coast Marsh,
W81-02840 2L

SAM RAYBURN RESERVOIR
Effects of the Rate of Releases From Sam Rayburn Reservoir on the Aeration Capacity of the Angelina River, Eastern Texas,
W81-02686 4A

SAN DIEGO MARINE LIFE REFUGE
San Diego Marine Life Refuge, San Diego County.
W81-02800 5C

SAND AQUIFERS
Groundwater Hydrology of James City County, Virginia,
W81-02695 2F

SANDY CREEK QUADRANGLE (NY)
Surficial Geology of Part of Sandy Creek Quadrangle, Oswego County, New York,
W81-02666 7C

SANTA FE COUNTY
Hydrologic Maps and Data for Santa Fe County, New Mexico,
W81-02703 7C

SATELLITE TECHNOLOGY
Transport of Mining Waste in Lake Superior,
W81-02739 5B

SATELLITES (ARTIFICIAL)
Snowpack Monitoring in North America and Eurasia Using Passive Microwave Satellite Data,
W81-02869 7B

SCHEDULING
Use of Crop Canopy-Air Temperature Difference for Irrigation Scheduling,
W81-02724 3F

SCOTLAND
Organochlorine Compounds in Mussels From Scottish Coastal Waters,
W81-02858 5A

SEA WATER
Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

The Effect of Glucose on the Productivity of Seawater: An Experimental Approach Using Controlled Aquatic Ecosystems,
W81-02825 5C

Simultaneous Measurements of Transparency and Irradiance in the Coastal Waters of North Wales,
W81-02892 5A

SEASONAL
Some Ecological Observations on Environmental Parameters, Planktonic Seasonal Succession and Biomass in Rio Cruces (Prov. Valdivia), South Chile,
W81-02876 5C

SEASONAL DISTRIBUTION
A Segmented Model of the Dynamics of the Ecosystem of Lake Baikal Considering Three-Dimensional Circulation of the Water,
W81-02747 2H

SEATTLE
The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

SEAWATER
An Ion-Exchange Technique for Concentrating Ammonia From Small Volumes of Seawater,
W81-02823 5A

SEDIMENT DISTRIBUTION
The Distribution of Sediments and Particulate Contaminants from Combined Sewer and Storm Drain Overflows i Seattle's Nearshore Waters,
W81-02753 5B

SEDIMENT TRANSPORT
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part I. River Hydraulics and Sediment Transport, 1979,
W81-02704 2J

The Transport of Contaminants in Lake Erie,
W81-02744 5B

SEDIMENTS
Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

The Distribution of the Polychaete Capitella Capitata (Fabricius) in Dock Sediments,
W81-02887 5C

SEMIPERMEABLE MEMBRANES
Laboratory and Field Evaluation of NS-100 Reverse Osmosis Membrane,
W81-02777 5D

SEPARATION TECHNIQUES
Process for Removal of Discrete Particulates and Solutes from Liquids by Foam Flotation,
W81-02660 5D

Enumeration and Characterization of Standard Plate Count Bacteria in Chlorinated and Raw Water Supplies,
W81-02848 5A

Simple Method for Concentration of Bacteria From Large Volumes of Tap Water,
W81-02853 5A

Comparison of the Different Methods for the Recovery of Suspended Matter From Estuarine Waters: Deposition, Filtration and Centrifugation: Consequences for the Determination of Some Heavy Metals,
W81-02888 5A

SETTLING BASINS
Effects of Coal-Ash Leachate on Ground Water Quality,
W81-02785 5B

SEWAGE BACTERIA
Evidence for Cometabolism in Sewage,
W81-02849 5B

SEWAGE EFFLUENTS
Impact of a Combined Sewer Overflow on the Abundance, Distribution, and Community Structure of Subtidal Benthos,
W81-02820 5C

SEWAGE SLUDGE
The Statistical Distribution of Sewage and Sludge Analyses,
W81-02817 5A

Elemental Content of Vegetables and Apple Trees Grown on Syracuse Sludge-Amended Soils,
W81-02830 5E

Modeling Sewage Sludge Decomposition in Soil: 1. Organic Carbon Transformation,
W81-02837 5D

Modeling Sewage Sludge Decomposition in Soil: II. Nitrogen Transformations,
W81-02838 5E

SEWAGE TREATMENT
Reconstruction of Maldon STW,
W81-02899 5D

SHALES
Chemical and Mineralogical Composition and Behavior of the Mancos Shale as a Diffuse Source of Salts in the Upper Colorado River Basin,
W81-02711 5B

SHELLFISH
Rate of Occurrence of False-Positive Results From Total Coliform Most-Probable-Number Analysis of Shellfish and Estuaries,
W81-02847 2L

SIMULATION
Control of the Water Resources of the Azov Sea Using the 'Azov Problem' Family of Simulation Systems,
W81-02743 6A

SIMULATION ANALYSIS
Simulation of the Distribution of Polluted Water in Reservoirs From Concentrated Emissions,
W81-02736 5B

Development of a Groundwater Model for the Henry's Fork and Rigby Fan Areas, Upper Snake River Basin, Idaho,
W81-02804 6A

SKINNER LAKE
A Comparison of Rain-Related Phosphorus and Nitrogen Loading from Urban, Wetland, and Agricultural Sources,
W81-02751 5C

SLUDGE
The Comparison of Soy-Bean Wastes, Used Tea Leaves and Sewage Sludge for Growing Chlorella Pyrenoidosa,
W81-02861 5D

SLUDGE DISPOSAL
The Statistical Distribution of Sewage and Sludge Analyses,
W81-02817 5A

Atmospheric Emissions of Elements on Particles From the Parkway Sewage-Sludge Incinerator,
W81-02855 5E

Detection of Dimethylnitrosamine and Diethylnitrosamine in Municipal Sewage Sludge Applied to Agricultural Soils,
W81-02866 5A

SMALL WATERSHEDS
Evaluation of Peak-Flow Data Network of Small Streams in Missouri,
W81-02689 2E

SNOW SURVEYS
Snowpack Monitoring in North America and Eurasia Using Passive Microwave Satellite Data,
W81-02869 7B

SNOWMELT
Development of a Streamflow Forecasting Procedure for Intermountain Basins,
W81-02726 6A

SOIL AMENDMENTS
Elemental Content of Vegetables and Apple Trees Grown on Syracuse Sludge-Amended Soils,
W81-02830 5E

SOIL CONSERVATION
Conservation Tillage: Best Management Practice for Nonpoint Runoff,
W81-02818 4D

SOIL CONTAMINATION
Mechanisms of Transport of Copper, Cadmium and Chromium in Soils,
W81-02653 5B

SOIL ENGINEERING
Relationships Between Basic Soils-Engineering Equations and Basic Ground-Water Flow Equations,
W81-02708 2F

SOIL WATER
Aircraft Remote Sensing of Soil Moisture and Hydrologic Parameters, Chickasha, Okla., and Riesel, Tex., 1978 Data Report,
W81-02782 2G

Changes in Nitrogen Cycling at an Old-Growth Douglas-Fir Site After Disturbance,
W81-02844 5C

SOIL-WATER-PLANT RELATIONSHIPS
Irrigation of Crops in the Southeastern United States, Principles and Practice,
W81-02780 3F

SOLAR RADIATION
A Solar Heated Fish Hatchery Water Recycling System,
W81-02709 8I

SOUTH AFRICA
Analyses of South African Rainfall,
W81-02873 2B

SOUTH CAROLINA
Geochemistry of Fluoride in the Black Creek Aquifer System of Horry and Georgetown Counties, South Carolina--and its Physiological Implications,
W81-02677 5G

SOUTHERN LOUISIANA
Water Resources Data for Louisiana, Water Year 1980--Volume 2. Southern Louisiana.
W81-02674 7C

SOUTHWEST U.S
Study Plan for the Regional Aquifer-System Analysis of Alluvial Basins in South-Central Arizona and Adjacent States,
W81-02701 6A

SOYBEAN WASTES
The Comparison of Soy-Bean Wastes, Used Tea Leaves and Sewage Sludge for Growing Chlorella Pyrenoidosa,
W81-02861 5D

SPRAY IRRIGATION
Waste Water Spray Transport in Land Application,
W81-02722 3F

ST. LAWRENCE RIVER
Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

ST. LAWRENCE RIVER BASIN
Ground-Water Quality and Data on Wells and Springs in Pennsylvania, Volume I--Ohio and St. Lawrence River Basins,
W81-02675 7C

STANDARD DEVIATION
Flood Frequency Modeling and Outliers,
W81-02803 2E

STARCH
Utilization of Low Concentrations of Starch by a Flavobacterium Species Isolated From Tap Water,
W81-02851 5A

STATISTICAL METHODS
Statistics of Receiving Water Response to Runoff,
W81-02766 5C

Flood Frequency Modeling and Outliers,
W81-02803 2E

The Statistical Distribution of Sewage and Sludge Analyses,
W81-02817 5A

STATISTICS
Computer Routines for Probability Distributions, Random Numbers, and Related Functions,
W81-02693 6A

STEADY FLOW
Algorithms for Pipe Network Analysis and Their Reliability,
W81-02658 8C

STORAGE CAPACITY
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

STORM OVERFLOW SEWERS
Urban Stormwater Impacts on Receiving Streams in North Carolina,
W81-02756 5C

STORM RUNOFF
Urban Runoff Receiving Water Impacts: Program Overview and Research Needs,
W81-02748 5C

The Effect of Urban Stormwater Runoff on the Water Quality of Lake Jackson, Florida,
W81-02750 5C

The Distribution of Sediments and Particulate Contaminants from Combined Sewer and Storm Drain Overflows i Seattle's Nearshore Waters,
W81-02753 5B

The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

Dissolved Oxygen Impact from Urban Storm Runoff,
W81-02757 5C

Impacts of Intermittent Urban Discharges on Receiving Waters,
W81-02759 5C

The Response of Great Lakes Estuaries to Stormwater Runoff,
W81-02760 5C

Productivity Responses of Lake Eola to Urban Runoff,
W81-02763 5C

Water Quality and Biological Degradation in an Urban Creek,
W81-02764 5C

Nationwide Assessment of Urban Stormwater Pollution Impacts on Receiving Water Bodies,
W81-02765 5C

Statistics of Receiving Water Response to Runoff,
W81-02766 5C

Potential of Urban Stormwater Impacts Based on Comparative Analysis of Wet and Dry Weather Pollutant Loads,
W81-02768 5C

Methodology for Evaluating the Impact and Abatement of Combined Sewer Overflows, A Case Study of Onondaga Lake, New York,
W81-02770 5C

STORM SEWERS
Analysis of Receiving Stream Impacts on the Milwaukee River,
W81-02755 5C

Urban Stormwater Impacts on Receiving Streams in North Carolina,
W81-02756 5C

STORM WASTE WATER
The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

Continuous Receiving Water Quality Modeling for Urban Stormwater Management,
W81-02767 5C

STORM WASTEWATER
Urban Runoff Receiving Water Impacts: Program Overview and Research Needs,
W81-02748 5C

The Distribution of Sediments and Particulate Contaminants from Combined Sewer and Storm Drain Overflows i Seattle's Nearshore Waters,
W81-02753 5B

STORM WATER
The Response of Great Lakes Estuaries to Stormwater Runoff,
W81-02760 5C

STORMWATER RUNOFF
Impacts of Stormwater Runoff on a Florida Lake Ecosystem: Effects on Water Quality and Biota,
W81-02752 5C

STREAM BANKS
Bank Erosion of the Illinois River,
W81-02791 2J

STREAM BIOTA
The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

Urban Stormwater Impacts on Receiving Streams in North Carolina,
W81-02756 5C

STREAM DEGRADATION
Urban Stormwater Impacts on Receiving Streams in North Carolina,
W81-02756 5C

STREAM POLLUTION
The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

STREAMBEDS
Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part II. Bed Elevations, 1979,
W81-02705 2J

STREAMFLOW
Streamflow Statistical Summaries for Colorado Streams Through September 30, 1975, Volume 2: Colorado River Basin Above Gunnison River,
W81-02676 7C

Selected Chemical Quality Characteristics in Streams of Kentucky, 1970-75.
W81-02680 2K

Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part I. River Hydraulics and Sediment Transport, 1979,
W81-02704 2J

Field Data Describing the Movement and Storage of Sediment in the East Fork River, Wyoming. Part II. Bed Elevations, 1979,
W81-02705 2J

STREAMFLOW FORECASTING
Development of a Streamflow Forecasting Procedure for Intermountain Basins,
W81-02726 6A

STREAMS
Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

Behavioral and Catastrophic Drift of Invertebrates in Two Streams in Northeastern Wyoming,
W81-02702 2E

Temporal Patterns in Recolonization of Stream Benthos,
W81-02883 5C

SUNSPOTS
Analyses of South African Rainfall,
W81-02873 2B

SURFACE-GROUNDWATER RELATIONSHIPS
Effects of the Proposed Prosperity Reservoir on Ground Water and Water Quality in Lower Center Creek Basin, Missouri,
W81-02678 5B

Geohydrology of the Delta-Clearwater Area, Alaska,
W81-02688 2F

SURFACE WATER
Water Resources Data for Louisiana, Water Year 1980--Volume 2. Southern Louisiana.
W81-02674 7C

Water Resources Data for Nevada, Water Year 1979.
W81-02698 7C

SURFACE WATERS
Water Resources Data for California, Water Year 1979--Volume 2. Pacific Slope Basins from Arroyo Grande to Oregon State Line Except Central Valley.
W81-02672 7C

Water Resources Data for California, Water Year 1979--Volume 3. Southern Central Valley Basins and the Great Basin from Walker River to Truckee River.
W81-02673 7C

Water Resources Data for Alabama, Water Year 1979--Volume 1. Apalachicola, Choctawatchee, Blackwater, Escambia, Perdido, and Alabama River Basins.
W81-02706 7C

Water Resources Data for Alabama, Water Year 1979--Volume 2. Tombigbee, Mobile, Dog, Pascagoula, and Tennessee River Basins.
W81-02707 7C

SURVEYS
Aquaculture: Catfish and Trout, Inventory and Sales, 1980.
W81-02776 8I

SUSPENDED SOLIDS
Results of a Joint USA/USSR Hydrodynamic Modeling Project for Lake Baikal,
W81-02737 2H

Clay is Mosinee's Choice for Reducing TSS Discharge from Clarifier,
W81-02874 5D

Comparison of the Different Methods for the Recovery of Suspended Matter From Estuarine Waters: Deposition, Filtration and Centrifugation: Consequences for the Determination of Some Heavy Metals,
W81-02888 5A

Simultaneous Measurements of Transparency and Irradiance in the Coastal Waters of North Wales,
W81-02892 5A

SWAMPS
Summary of Hydrologic Data for the East Everglades, Dade County, Florida,
W81-02697 7C

SWEDEN
Distribution of Activation Products from Barseback Nuclear Power Plant (Sweden) in the Marine Environment. Temporal and Spatial Variations as Established by Seaweed,
W81-02815 5B

TANNERY WASTES
Wastewater Effluents From a Tannery: Their Effects on Soil and Vegetation in Pakistan,
W81-02897 3C

TEA LEAF WASTES
The Comparison of Soy-Bean Wastes, Used Tea Leaves and Sewage Sludge for Growing Chlorella Pyrenoidosa,
W81-02861 5D

TEMPERATURE CONTROL
Temperature-Controlled Recirculating System for Hatching Catostomid Larvae,
W81-02728 8I

TEMPORAL DISTRIBUTION
Temporal Patterns in Recolonization of Stream Benthos,
W81-02883 5C

TEXAS
Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1974-September 1975,
W81-02684 2L

Effects of the Rate of Releases From Sam Rayburn Reservoir on the Aeration Capacity of the Angelina River, Eastern Texas,
W81-02686 4A

Survey and Control of Synthetic Organics in Texas Water Supplies,
W81-02719 5A

Water Quality and Urban Runoff in Selected Canal Communities Along the Texas Coast,
W81-02761 5C

Persistence of Spilled Oil in a Texas Salt Marsh,
W81-02857 5B

THERMAL POLLUTION
Non-Radiological Environmental Implications of Nuclear Energy,
W81-02895 5C

THERMAL STRESS
Thermal Tolerance of the Isopod Lirceus Brachyurus (Crustacea:Isopoda),
W81-02810 5C

THERMAL WATER
Non-Radiological Environmental Implications of Nuclear Energy,
W81-02895 5C

THESAURI
Water Resources Thesaurus, Third Edition.
W81-02718 10C

TOXICITY
Mechanisms by Which Acid Precipitation Produces Embryonic Death in Aquatic Vertebrates,
W81-02716 5C

Algal Response to Copper Under Riverine Conditions,
W81-02862 5C

The Effect of a Fluoride Effluent on Marine Organisms,
W81-02863 5C

The Chronic Toxicity to Daphnia Magna of Acridine, a Representative Azaarene Present in Synthetic Fossil Fuel Products and Waste Waters,
W81-02864 5C

TRACE LEVELS
Development of Methods for the Detection of Trace Amounts of Selected Carcinogenic and Mutagenic Amines in Water,
W81-02721 5A

TROUT
The WRRI Trout Cover Rating Method: Development and Application,
W81-02717 8I

Aquaculture: Catfish and Trout, Inventory and Sales, 1980.
W81-02776 8I

TROUT COVER
The WRRI Trout Cover Rating Method: Development and Application,
W81-02717 8I

TROUT HABITAT
The WRRI Trout Cover Rating Method: Development and Application,
W81-02717 8I

TURBIDITY
Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

ULTIMATE DISPOSAL
Atmospheric Emissions of Elements on Particles From the Parkway Sewage-Sludge Incinerator,
W81-02855 5E

UNITED STATES GEOLOGICAL SURVEY
USGS: Its Water Resources Research Activity,
W81-02839 9C

URBAN RUNOFF
The Distribution, Transport and Cycling of Dissolved and Particulate Organic Carbon in the Potomac and Anacostia Rivers in the Greater Washington Area,
W81-02656 5B

Urban Runoff Receiving Water Impacts: Program Overview and Research Needs,
W81-02748 5C

An Approach for Assessing the Water Quality Significance of Chemical Contaminants in Urban Lakes,
W81-02749 5C

The Effect of Urban Stormwater Runoff on the Water Quality of Lake Jackson, Florida,
W81-02750 5C

A Comparison of Rain-Related Phosphorus and Nitrogen Loading from Urban, Wetland, and Agricultural Sources,
W81-02751 5C

The Ecological Effects of Urban Runoff on Stream Communities,

A Two-Mode Free-Surface Numerical Model for the Three-Dimensional Time-Dependent Currents in Large Lakes,
W81-02778 2H

WATER DEMAND
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

Appraisal of Ground-Water Resouces in the San Antonio Creek Valley, Santa Barbara County, California,
W81-02700 6D

WATER DISTRIBUTION
Algorithms for Pipe Network Analysis and Their Reliability,
W81-02658 8C

WATER LAW
Evaluation of the Impact Imposed upon Surface Water Sources by Implementation of the Federal Water Conservation and Reuse Policy in a River Basin with a Water Surplus,
W81-02654 3C

WATER LEVELS
Selected Water-Level Records for Oklahoma, 1979-80,
W81-02683 2F

Effects of Artificial-Recharge Experiments at Ship Creek Alluvial Fan on Water Levels at Spring Acres Subdivision, Anchorage, Alaska,
W81-02696 4B

WATER MANAGEMENT
The Politics of Water Pollution Control: A Case Study of the Formation of the Canada Water Act, Part I: Comprehensive Water Resource Management: Part II: Nutrient Control,
W81-02836 6E

WATER MANAGEMENT (APPLIED)
Bayes-Markov Analysis for Rain-Catchment Cisterns,
W81-02657 4A

WATER POLICY
Public Attitudes of Nebraskans Toward Water Policy,
W81-02725 6E

The Politics of Water Pollution Control: A Case Study of the Formation of the Canada Water Act, Part I: Comprehensive Water Resource Management: Part II: Nutrient Control,
W81-02836 6E

WATER POLLUTION
Interchange of Pollutants Between Groundwater and Mineral Strata as Applied to Waste Chemical Dumps and in Situ Coal Gasification Sites,
W81-02714 5B

Development of Methods for the Detection of Trace Amounts of Selected Carcinogenic and Mutagenic Amines in Water,
W81-02721 5A

The Transport of Contaminants in Lake Erie,
W81-02744 5B

Self-Organization of Three-Dimensional Models of Water Pollution,
W81-02745 5B

The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a Small Stream,
W81-02758 5C

Impacts of Intermittent Urban Discharges on Receiving Waters,
W81-02759 5C

The Response of Great Lakes Estuaries to Stormwater Runoff,
W81-02760 5C

The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

Productivity Responses of Lake Eola to Urban Runoff,
W81-02763 5C

Water Quality and Biological Degradation in an Urban Creek,
W81-02764 5C

Nationwide Assessment of Urban Stormwater Pollution Impacts on Receiving Water Bodies,
W81-02765 5C

Statistics of Receiving Water Response to Runoff,
W81-02766 5C

Continuous Receiving Water Quality Modeling for Urban Stormwater Management,
W81-02767 5C

Potential of Urban Stormwater Impacts Based on Comparative Analysis of Wet and Dry Weather Pollutant Loads,
W81-02768 5C

The Use of Receiving Water Quality Models in Urban Runoff Pollution Abatement: Application to Marginal Benefit - Marginal Cost Analysis,
W81-02769 5C

Methodology for Evaluating the Impact and Abatement of Combined Sewer Overflows, A Case Study of Onondaga Lake, New York,
W81-02770 5C

Coliforms and Fecal Streptococcus in the Illinois River at Peoria, 1971-1976,
W81-02792 5B

WATER POLLUTION CONTROL

Use of Calcium Stripping Column to Achieve Energy Conservation and Residue Reuse in Phosphate Precipitation by Lime,
W81-02713 5D

Phosphate Removal with Calcium Carbonate Precipitation in the Lake of Constance (Obersee). (Phosphatelimination Durch Autochthone Calcitfallung Im Bodensee-Obersee),
W81-02882 5D

Poland Launches Major Program to Restore and Regulate Country's Largest River System,
W81-02889 5D

WATER POLLUTION EFFECTS

Hydrochemical and Geophysical Investigation of the Effects of Fly-Ash Disposal on Groundwater,
W81-02651 5C

Effects of Fly Ash Heavy Metals on Daphnia Magna,
W81-02715 5B

Measurement of Physiological Condition of Mussels Transplanted Along a Pollution Gradient in Narragansett Bay,
W81-02819 5C

Sediment Characteristics of Eleocharis Acicularis (L.) R. S. Sites in Streams and Lakes of Central Pennsylvania,
W81-02821 5C

Coal-Liquefaction Products, Shale Oil, and Petroleum. Acute Toxicity to Freshwater Algae,
W81-02854 5C

Use of Synthetic Detergents in Malaysia,
W81-02896 5C

WATER POLLUTION SOURCES

Seawater Intrusion and Potential Yield of Aquifers in the Soquel-Aptos Area, Santa Cruz County, California,
W81-02690 5B

Optimal Sampling for Long Term Trends in Lake Huron,
W81-02733 7B

A Model Approach to Estimating the Effects of Anthropogenic Influences on the Ecosystem of Lake Baikal,
W81-02734 5C

Water Quality and Biological Degradation in an Urban Creek,
W81-02764 5C

WATER POLLUTION TREATMENT

Process for Removal of Discrete Particulates and Solutes from Liquids by Foam Flotation,
W81-02660 5D

WATER PURIFICATION

The Effect of pH on the Coagulation and Purification of Wastewater,
W81-02832 5D

Franklaw Water Treatment Works.
W81-02898 5F

WATER QUALITY

Evaluation of the Impact Imposed upon Surface Water Sources by Implementation of the Federal Water Conservation and Reuse Policy in a River Basin with a Water Surplus,
W81-02654 3C

Water Resources Data for California, Water Year 1979--Volume 2. Pacific Slope Basins from Arroyo Grande to Oregon State Line Except Central Valley.
W81-02672 7C

Water Resources Data for California, Water Year 1979--Volume 3. Southern Central Valley Basins and the Great Basin from Walker River to Truckee River.
W81-02673 7C

Water Resources Data for Louisiana, Water Year 1980--Volume 2. Southern Louisiana.
W81-02674 7C

Ground-Water Quality and Data on Wells and Springs in Pennsylvania, Volume I--Ohio and St. Lawrence River Basins,
W81-02675 7C

Geochemistry of Fluoride in the Black Creek Aquifer System of Horry and Georgetown Counties, South Carolina--and its Physiological Implications,
W81-02677 5G

Effects of the Proposed Prosperity Reservoir on Ground Water and Water Quality in Lower Center Creek Basin, Missouri,
W81-02678 5B

Selected Chemical Quality Characteristics in Streams of Kentucky, 1970-75.
W81-02680 2K

Measurements of Discharge, Gain or Loss in Flow, and Chemical Quality of the Poplar and Redwater Rivers, Northeastern Montana, October 24-25, 1979,
W81-02682 7C

Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1974-September 1975,
W81-02684 2L

A Water-Quality Monitoring Network for Vallecitos Valley, Alameda County, California,
W81-02685 5B

Effects of the Rate of Releases From Sam Rayburn Reservoir on the Aeration Capacity of the Angelina River, Eastern Texas,
W81-02686 4A

Water Resources Data for Nevada, Water Year 1979.
W81-02698 7C

Water-Resources Investigations, Collier County, Florida,
W81-02699 5G

Water Resources Data for Alabama, Water Year 1979--Volume 1. Apalachicola, Choctawatchee, Blackwater, Escambia, Perdido, and Alabama River Basins.
W81-02706 7C

Water Resources Data for Alabama, Water Year 1979--Volume 2. Tombigbee, Mobile, Dog, Pascagoula, and Tennessee River Basins.
W81-02707 7C

Water Quality of a Reservoir Used for Reclaimed Water Storage,
W81-02712 5G

Basic Trends in the Study of Hydrochemical Fields and the Structure of Their Space-Time Heterogeneities,
W81-02730 7A

Modeling the Great Lakes - A History of Achievement,
W81-02731 7A

Data Management Requirements for Great Lakes Water Quality Modeling,
W81-02732 7C

Principle of Organization of an Automated Information System,
W81-02740 7C

Water Quality and Urban Runoff in Selected Canal Communities Along the Texas Coast,
W81-02761 5C

WATER QUALITY CONTROL

Survey and Control of Synthetic Organics in Texas Water Supplies,
W81-02719 5A

The Effect of Heavy Metals on the Performance of Rotating Biological Contactors (RBC),
W81-02723 5D

Changes in Nitrogen Cycling at an Old-Growth Douglas-Fir Site After Disturbance,
W81-02844 5C

WATER QUALITY MANAGEMENT

A Water Quality Planning Methodology for Urban Areas,
W81-02771 6B

WATER QUALITY STANDARDS

Dissolved Oxygen Impact from Urban Storm Runoff,
W81-02757 5C

WATER RATES

The Search for Equity and Efficiency in the Pricing of a Public Service: Urban Water,
W81-02831 6C

WATER RECLAMATION

Evaluation of Industrial Cooling Systems Using Reclaimed Municipal Waste water, Application for Potential Users,
W81-02802 3C

WATER RESOURCES

Water-Resources Investigations, Collier County, Florida,
W81-02699 5G

Water Resources Thesaurus, Third Edition.
W81-02718 10C

USGS: Its Water Resources Research Activity,
W81-02839 9C

WATER RESOURCES DEVELOPMENT

Control of the Water Resources of the Azov Sea Using the 'Azov Problem' Family of Simulation Systems,
W81-02743 6A

Poland Launches Major Program to Restore and Regulate Country's Largest River System,
W81-02889 5D

WATER REUSE

Evaluation of the Impact Imposed upon Surface Water Sources by Implementation of the Federal Water Conservation and Reuse Policy in a River Basin with a Water Surplus,
W81-02654 3C

A Solar Heated Fish Hatchery Water Recycling System,
W81-02709 8I

WATER REUSE

Advanced Pretreatment Process for Waste Water Reuse Using Reverse Osmosis,
W81-02710 5D

Evaluation of Industrial Cooling Systems Using Reclaimed Municipal Waste water, Application for Potential Users,
W81-02802 3C

WATER RIGHTS
California's Water Conflict: North vs South,

OREGON STATE UNIV., CORVALLIS. SCHOOL OF FORESTRY.
Sediment and Organic Matter Transport in Oregon Coast Range Streams,
W81-02652 5B

ORLEANS UNIV. (FRANCE).
Pollution of Sea Water and Marine Sediments in Coastal Areas,
W81-02808 5B

OTAGO UNIV., PORTOBELLO (NEW ZEALAND). MARINE LAB.
The Effect of a Fluoride Effluent on Marine Organisms,
W81-02863 5C

OXFORD UNIV. (ENGLAND), DEPT. OF AGRICULTURAL SCIENCE.
The Statistical Distribution of Sewage and Sludge Analyses,
W81-02817 5A

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. DEPT. OF BOTANY.
Sediment Characteristics of Eleocharis Acicularis (L.) R. S. Sites in Streams and Lakes of Central Pennsylvania,
W81-02821 5C

PENNSYLVANIA UNIV., PHILADELPHIA.
The Search for Equity and Efficiency in the Pricing of a Public Service: Urban Water,
W81-02831 6C

PRINCETON UNIV., NJ. DEPT. OF GEOLOGICAL AND GEOPHYSICAL SCIENCES.
Relative Degradation Rates of NTA, EDTA and DTPA and Environmental Implications,
W81-02868 5B

PULP AND PAPER RESEARCH INST. OF CANADA, POINTE CLAIRE (QUEBEC).
Isolation and Identification of an Ames-Mutagenic Compound Present in Kraft Chlorination Effluents,
W81-02875 5A

PURDUE UNIV., LAFAYETTE, IN. DEPT. OF FORESTRY AND NATURAL RESOURCES.
Temperature-Controlled Recirculating System for Hatching Catostomid Larvae,
W81-02728 8I

QUEBEC UNIV., RIMOUSKI. DEPT. OF OCEANOGRAPHIC.
Factors Influencing Particulate Matter Geochemistry in the St. Lawrence Estuary Turbidity Maximum,
W81-02822 2L

RESOURCES CONSERVATION CO., SEATTLE, WA.
High Recovery Seed Slurry Reverse Osmosis Demonstration for Desalting Waters Saturated in Calcium Sulfate.
W81-02659 3A

RHODE ISLAND UNIV., KINGSTON. GRADUATE SCHOOL OF OCEANOGRAPHY.
Isolation of Dissolved Organic Matter and Copper-Organic Complexes From Estuarine Waters Using Reverse-Phase Liquid Chromatography,
W81-02824 5A

ROSTOV-ON-DON STATE UNIV. (USSR). INST. OF MECHANICS AND APPLIED MATHEMATICS.
A Model Approach to Estimating the Effects of Anthropogenic Influences on the Ecosystem of Lake Baikal,
W81-02734 5C

Control of the Water Resources of the Azov Sea Using the 'Azov Problem' Family of Simulation Systems,
W81-02743 6A

RUTGERS - THE STATE UNIV., NEW BRUNSWICK, NJ. DEPT. OF ENVIRONMENTAL SCIENCE.
The Nitrogen Cycle in the Delaware River,
W81-02727 5C

RUTGERS - THE STATE UNIV., NEW BRUNSWICK, NJ. DEPT. OF SOILS AND CROPS.
Modeling Sewage Sludge Decomposition in Soil: 1. Organic Carbon Transformation,
W81-02837 5D

Modeling Sewage Sludge Decomposition in Soil: II. Nitrogen Transformations,
W81-02838 5E

SCARBOROUGH COLL., TORONTO (ONTARIO). DIV. OF LIFE SCIENCES.
Temporal Patterns in Recolonization of Stream Benthos,
W81-02883 5C

SCIENCE AND EDUCATION ADMINISTRATION, BELTSVILLE, MD. HYDROLOGY LAB.
Aircraft Remote Sensing of Soil Moisture and Hydrologic Parameters, Chickasha, Okla., and Riesel, Tex., 1978 Data Report,
W81-02782 2G

SCIENCE AND EDUCATION ADMINISTRATION, MANHATTAN, KS. NORTH CENTRAL REGION.
Application of Wind Energy to Great Plains Irrigation Pumping,
W81-02781 8C

SCS ENGINEERS, COVINGTON, KY.
Waste Impoundment Assessment in the State of Indiana,
W81-02842 5B

SEA RUN, INC., KENNEBUNKPORT, ME.
A Solar Heated Fish Hatchery Water Recycling System,
W81-02709 8I

SEVERN-TRENT WATER AUTHORITY, NOTTINGHAM (ENGLAND). REGIONAL LAB.
Determination of Lead in Drinking Water by Atomic Absorption Spectrophotometry with Electrothermal Atomisation,
W81-02811 5A

SOUTHEASTERN FOREST EXPERIMENT STATION, FRANKLIN, NC. COWEETA HYDROLOGIC LAB.
Coweeta Hydrologic Laboratory, 1934-2034: Past, Present and Future,
W81-02729 9C

SOUTHERN PIEDMONT CONSERVATION RESEARCH CENTER, WATKINSVILLE, GA.
Irrigation of Crops in the Southeastern United States, Principles and Practice,
W81-02780 3F

STAATLICHES INST. FUER SEENFORCHUNG UND FISCHEREIWESEN, LANGENARGEN (GERMANY, F. R.).
Phosphate Removal with Calcium Carbonate Precipitation in the Lake of Constance (Obersee). (Phosphatelimination Durch Autochthone Calcitfallung Im Bodensee-Obersee),
W81-02882 5D

STATE UNIV. OF NEW YORK COLL. AT BUFFALO. DEPT. OF BIOLOGY.
Algal Response to Copper Under Riverine Conditions,
W81-02862 5C

STATION MARINE, VILLEFRANCE-SUR-MER (FRANCE). LAB. DE PHYSIQUE ET CHIMIE MARINES.
Phosphorus and Nitrogen in the Mediterranean Sea: Budgets and Potential Fertility. (Le Phosphore et L'Azote En Mer Mediterranee, Bilans et Fertilite Potentielle),
W81-02891 5B

STEARNS AND WHELER, CAZENOVIA, NY.
Methodology for Evaluating the Impact and Abatement of Combined Sewer Overflows, A Case Study of Onondaga Lake, New York,
W81-02770 5C

SUTRON CORP., ARLINGTON, VA.
Dissolved Oxygen Impact from Urban Storm Runoff,
W81-02757 5C

SYRACUSE UNIV., NY.
Surficial Geology of New Haven Quadrangle, Oswego County, New York,
W81-02661 7C

Surficial Geology of Part of Lysander Quadrangle, Oswego County, New York,
W81-02663 7C

Surficial Geology of Redfield Quadrangle, Oswego County, New York,
W81-02664 7C

Surficial Geology of Oswego East Quadrangle, Oswego County, New York,
W81-02669 7C

Surficial Geology of Central Square Quadrangle, Oswego County, New York,
W81-02670 7C

Surficial Geology of Mexico Quadrangle, Oswego County, New York,
W81-02671 7C

TENNESSEE UNIV., KNOXVILLE. DEPT. OF ZOOLOGY.
Thermal Tolerance of the Isopod Lirceus Brachyurus (Crustacea:Isopoda),
W81-02810 5C

TENNESSEE VALLEY AUTHORITY, CHATTANOOGA, TN.
Effects of Coal-Ash Leachate on Ground Water Quality,
W81-02785 5B

TETRA TECH, INC., LAFAYETTE, CA.
The Ecological Effects of Urban Runoff on Stream Communities,
W81-02754 5C

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF CHEMISTRY.
Global Transport of Organic Pollutants: Ambient Concentrations in the Remote Marine Atmosphere,
W81-02872 5B

TEXAS A AND M UNIV., COLLEGE STATION. WATER RESOURCES INST.
Survey and Control of Synthetic Organics in Texas Water Supplies,
W81-02719 5A

TEXAS UNIV. AT PORT ARANSAS. MARINE SCIENCE INST.
Persistence of Spilled Oil in a Texas Salt Marsh,
W81-02857 5B

TORONTO UNIV. (ONTARIO). DEPT. OF ZOOLOGY.
Growth Responses of Yellow Perch, Perca Flavescens (Mitchill), to Lake Acidification in the La Cloche Mountain Lakes of Ontario,
W81-02833 5C

TSUKUBA UNIV., IBARAKI (JAPAN). INST. OF BIOLOGICAL SCIENCES.
Turnover Rate of Dissolved Organic Materials in Glacially-Oligotrophic and Dystrophic Lakes in British Columbia, Canada,
W81-02806 2H

TUEBINGEN UNIV. (GERMANY, F.R.). INST. FUER CHEMISCHE PFLANZENPHYSIOLOGIE.
Detection of Lipid Degradation Products in the Water of a Reservoir During a Bloom of Synura Uvella,
W81-02850 5A

UNION CARBIDE CORP., TARRYTOWN, NY.
Caprolactam Recovery from Aqueous Manufacturing Streams,
W81-02783 5D

UNIVERSIDADE FEDERAL DE MINAS GERIS, BELO HORIZONTE (BRAZIL). DEPT. OF GENERAL BIOLOGY.
Primary Production of Phytoplankton and Environmental Characteristics of a Shallow Quaternary Lake at Eastern Brazil,
W81-02878 5C

UNIVERSIDADE FEDERAL DO RIO DE JANEIRO (BRAZIL). DEPT. DE MICROBIOLOGIA GERAL.
Yeasts From Marine and Estuarine Waters with Different Levels of Pollution in the State of Rio De Janeiro, Brazil,
W81-02885 5A

UNIVERSIDADE FEDERAL DO RIO DE JANEIRO (BRAZIL). INST. DE BIOFISICA.
Fate of Chromium in a Tributary of the Iraja River, Rio De Janeiro,
W81-02865 5B

UNIVERSITY COLL. OF NORTH WALES, MENAI BRIDGE. MARINE SCIENCE LABS.
Simultaneous Measurements of Transparency and Irradiance in the Coastal Waters of North Wales,
W81-02892 5A

UNIVERSITY OF CENTRAL FLORIDA, ORLANDO. DEPT. OF CIVIL ENGINEERING AND ENVIRONMENTAL SCIENCE.
Productivity Responses of Lake Eola to Urban Runoff,
W81-02763 5C

UNIVERSITY OF THE PUNJAB., LAHORE (PAKISTAN). DEPT. OF BOTANY.
Wastewater Effluents From a Tannery: Their Effects on Soil and Vegetation in Pakistan,
W81-02897 3C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. OFFICE OF OCCUPATIONAL HEALTH AND SAFETY.
Elemental Content of Vegetables and Apple Trees Grown on Syracuse Sludge-Amended Soils,
W81-02830 5E

WAPORA, INC., CHICAGO, IL.
Small Scale Hydropower Development in Illinois: An Implementation Manual,
W81-02788 6B

Phase I Report - Inventory of Potential Small-Scale Hydropower Sites in Illinois and Selection of Projects Exhibiting Potential for Development,
W81-02789 6B

Phase II Report - Preliminary Investigation of Small-Scale Hydropower Potential at Five Sites in Illinois,
W81-02790 6B

WASHINGTON UNIV., SEATTLE. COLL. OF FISHERIES.
The Response of Subtidal Infaunal Communities to a Change in Wastewater Discharge,
W81-02762 5C

Impact of a Combined Sewer Overflow on the Abundance, Distribution, and Community Structure of Subtidal Benthos,
W81-02820 5C

WATER AND POWER RESOURCES SERVICE, DENVER, CO.
Safety Evaluation of Existing Dams, A Manual for the Safety Evaluation of Embankment and Concrete Dams.
W81-02774 8A

WESTFIELD COLL., LONDON (ENGLAND). DEPT. OF BOTANY AND BIOCHEMISTRY.
The Uptake of Lead and Copper by Submerged Aquatic Macrophytes in Two English Lakes,
W81-02827 5B

WISCONSIN UNIV.-MADISON. DEPT. OF SOIL SCIENCE.
Conservation Tillage: Best Management Practice for Nonpoint Runoff,
W81-02818 4D

WISCONSIN UNIV.-MADISON. WATER RESOURCES CENTER.
Hydrochemical and Geophysical Investigation of the Effects of Fly-Ash Disposal on Groundwater,
W81-02651 5C

WISCONSIN UNIV., STEVENS POINT. DEPT. OF PAPER SCIENCE AND ENGINEERING.
Clay is Mosinee's Choice for Reducing TSS Discharge from Clarifier,
W81-02874 5D

WOODWARD CLYDE CONSULTANTS, SAN FRANCISCO, CA.
Water Quality and Biological Degradation in an Urban Creek,
W81-02764 5C

WRIGHT STATE UNIV., DAYTON, OH. DEPT. OF BIOLOGICAL SCIENCES.
Detection of Dimethylnitrosamine and Diethylnitrosamine in Municipal Sewage Sludge Applied to Agricultural Soils,
W81-02866 5A

WYOMING UNIV., LARAMIE. WATER RESOURCES RESEARCH INST.
The WRRI Trout Cover Rating Method: Development and Application,
W81-02717 8I

YOKOHAMA NATIONAL UNIV. (JAPAN). INST. OF ENVIRONMENTAL SCIENCE AND TECHNOLOGY.
Studies on the Photochemical Decomposition of Organomercurials--Methylmercury(II) Chloride,
W81-02816 5B
